## J1.3 Shared pseudocode

This section holds the pseudocode that is common to execution in AArch64 state and in AArch32 state. Functions listed in this section are identified only by a `FunctionName`, without an `AArch64.` or `AArch32.` prefix. This section is organised by functional groups, with the functional groups being indicated by hierarchical path names, for example `shared/debug/DebugTarget`.

The top-level sections of the shared pseudocode hierarchy are:

- *shared/debug*.
- *shared/exceptions* on page J1-5360.
- *shared/functions* on page J1-5362.
- *shared/translation* on page J1-5413.

### J1.3.1 shared/debug

This section includes the following pseudocode functions:

- *shared/debug/ClearStickyErrors/ClearStickyErrors* on page J1-5345.
- *shared/debug/DebugTarget/DebugTarget* on page J1-5345.
- *shared/debug/DebugTarget/DebugTargetFrom* on page J1-5345.
- *shared/debug/DoubleLockStatus/DoubleLockStatus* on page J1-5346.
- *shared/debug/FindWatchpoint/FindWatchpoint* on page J1-5346.
- *shared/debug/authentication/AllowExternalDebugAccess* on page J1-5346.
- *shared/debug/authentication/AllowExternalPMUAccess* on page J1-5346.
- *shared/debug/authentication/Debug_authentication* on page J1-5347.
- *shared/debug/authentication/ExternalInvasiveDebugEnabled* on page J1-5347.
- *shared/debug/authentication/ExternalNoninvasiveDebugEnabled* on page J1-5347.
- *shared/debug/authentication/ExternalSecureInvasiveDebugEnabled* on page J1-5347.
- *shared/debug/authentication/ExternalSecureNoninvasiveDebugEnabled* on page J1-5347.
- *shared/debug/cti/CTI_SetEventLevel* on page J1-5348.
- *shared/debug/cti/CTI_SignalEvent* on page J1-5348.
- *shared/debug/cti/CrossTrigger* on page J1-5348.
- *shared/debug/dccanditr/CheckForDCCInterrupts* on page J1-5348.
- *shared/debug/dccanditr/DBGDTRRX_EL0* on page J1-5348.
- *shared/debug/dccanditr/DBGDTRTX_EL0* on page J1-5349.
- *shared/debug/dccanditr/DBGDTR_EL0* on page J1-5350.
- *shared/debug/dccanditr/DTR* on page J1-5351.
- *shared/debug/dccanditr/EDITR* on page J1-5351.
- *shared/debug/halting/DCPSInstruction* on page J1-5351.
- *shared/debug/halting/DRPSInstruction* on page J1-5352.
- *shared/debug/halting/DebugHalt* on page J1-5352.
- *shared/debug/halting/DisableITRAndResumeInstructionPrefetch* on page J1-5353.
- *shared/debug/halting/ExecuteA64* on page J1-5353.

*Non-Confidential - Beta*

## K1.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

ARMv8 defines architecturally-required constraints on many behaviors that are UNPREDICTABLE in ARMv7. The following sections define those constraints:

- *Overview of the constraints on ARMv7 UNPREDICTABLE behaviors* on page K1-5423.
- *Using R13* on page K1-5423.
- *Using R15* on page K1-5423.
- *Branching into an IT block* on page K1-5424.
- *Branching to an unaligned PC* on page K1-5424.
- *Loads and Stores to unaligned locations* on page K1-5424.
- *CONSTRAINED UNPREDICTABLE instructions in an IT block* on page K1-5425.
- *Unallocated CP14 and CP15 instructions* on page K1-5426.
- *SBZ or SBO fields in instructions* on page K1-5426.
- *Immediate constants in T32 data processing instructions* on page K1-5427.
- *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.
- *CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values* on page K1-5427.
- *CONSTRAINED UNPREDICTABLE behavior due to inadequate context synchronization* on page K1-5427
- *Translation Table Base Address alignment* on page K1-5428.
- *Handling of conceptual coprocessors CP10 and CP11* on page K1-5428.
- *Performance Monitors Extension* on page K1-5428.
- *Syndrome register handling for CONSTRAINED UNPREDICTABLE instructions treated as UNDEFINED* on page K1-5430.
- *Out of range virtual address* on page K1-5430.
- *Instruction fetches from Device memory* on page K1-5431.
- *Multi-access instructions that load the PC from Device memory* on page K1-5431.
- *Programming CSSELR.Level for a cache level that is not implemented* on page K1-5431.
- *Crossing a page boundary with different memory types or Shareability attributes* on page K1-5431.
- *Crossing a 4KB boundary with a Device access* on page K1-5432.
- *CONSTRAINED UNPREDICTABLE behavior for memory hints, Advanced SIMD instructions, and miscellaneous A32 instructions* on page K1-5432.
- *Out of range values of the Set/Way/Index fields in cache maintenance instructions* on page K1-5432.
- *CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instructions in the base instruction set* on page K1-5433.
- *CONSTRAINED UNPREDICTABLE behavior for A32 and T32 system instructions in the base instruction set* on page K1-5478.
- *CONSTRAINED UNPREDICTABLE behavior, A32 and T32 Advanced SIMD and floating-point instructions* on page K1-5485.
- *CONSTRAINED UNPREDICTABLE behaviors associated with the VTCR* on page K1-5496.

- *CONSTRAINED UNPREDICTABLE behavior in Debug state* on page K1-5496.
- *CONSTRAINED UNPREDICTABLE behavior of EL2 features* on page K1-5497.

### K1.1.1 Overview of the constraints on ARMv7 UNPREDICTABLE behaviors

The term UNPREDICTABLE describes a number of cases where the architecture has a feature that software must not use. For execution in AArch32 state, where previous versions of the architecture define behavior as UNPREDICTABLE, the ARMv8-A architecture specifies a narrow range of permitted behaviors. This range is the range of CONSTRAINED UNPREDICTABLE behavior. All implementations that are compliant with the architecture must follow the CONSTRAINED UNPREDICTABLE behavior.

**Note**

Software designed to be compatible with the ARMv8-A architecture must not rely on these CONSTRAINED UNPREDICTABLE cases.

### K1.1.2 Using R13

In prior versions of the architecture, the use of R13 as a named register specifier was described as UNPREDICTABLE in the pseudocode. In the ARMv8-A architecture, the use of R13 as a named register specifier is not UNPREDICTABLE, unless this is specifically stated, and R13 can be used in the regular form. Bits[1:0] of R13 are not treated as RES0, but can hold any values programmed into them.

### K1.1.3 Using R15

All uses of R15 as a named register specifier for a source register that are described as CONSTRAINED UNPREDICTABLE in the pseudocode or in other places in this reference manual must do one of the following:

- Cause the instruction to be treated as an UNDEFINED instruction.
- Cause the instruction to execute as a `NOP`.
- Read the PC with the standard offset that applies for the current instruction set.
- Read the PC with the standard offset that applies for the current instruction set with alignment to a word boundary.
- Read 0.
- Read an UNKNOWN value.

All uses of R15 as a named register specifier for a destination register that are described as CONSTRAINED UNPREDICTABLE in the pseudocode or in other places in this reference manual must do one of the following:

- Cause the instruction to be treated as UNDEFINED.
- Cause the instruction to execute as a `NOP`.
- Ignore the write.
- Branch to an UNKNOWN location in either A32 or T32 state.

The choice between these behaviors might in some implementations vary from instruction to instruction, or between different instances of the same instruction.

Instructions that are CONSTRAINED UNPREDICTABLE when the base register is R15 and the instruction specifies a writeback of the base register, are treated as having R15 as both a source register and a destination register.

For instructions that have two destination registers, for example `LDRD`, `MRRC`, and many of the multiply instructions, if Rt, Rt2, RdLo, or RdHi is R15, then the other destination register of the pair is UNKNOWN, if the CONSTRAINED UNPREDICTABLE behavior for the write to R15 is either to ignore the write or to branch to an UNKNOWN location.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For instructions that affect any or all of PSTATE.{N, Z, C, V}, PSTATE.Q, and PSTATE.GE when the register specifier is not R15, any flags affected by an instruction that is CONSTRAINED UNPREDICTABLE when the register specifier is R15 become UNKNOWN,

In addition, for MRC instructions for CP14 and CP15 that use R15 as the destination register descriptor, and thereby target APSR_nzcv where these are described as being CONSTRAINED UNPREDICTABLE, PSTATE.{N, Z, C, V} becomes UNKNOWN.

### K1.1.4 Branching into an IT block

Branching into an IT block leads to CONSTRAINED UNPREDICTABLE behavior. Execution starts from the address determined by the branch, but each instruction in the IT block is:

- Executed as if it were not in an IT block. This means that it is executed unconditionally.
- Executed as if it had passed its Condition code check within an IT block.
- Executed as a NOP. That is, it behaves as if it had failed the Condition code check.

### K1.1.5 Branching to an unaligned PC

In A32 state, when branching to an address that is not word aligned and is defined to be CONSTRAINED UNPREDICTABLE, one of the following behaviors must occur:

- The unaligned location is forced to be aligned.
- The unaligned address generates an exception on the first instruction using the unaligned PC value.

  If that instruction is executed at EL0 and either of the following applies, the exception is taken to EL2:
  - EL2 is using AArch32 and the value of HCR.TGE is 1
  - EL2 is using AArch64 and the value of HCR_EL2.TGE is 1.

  If the instruction is executed at EL0 when the applicable TGE bit is 0 the exception is taken to EL1.

  If the instruction is executed at an Exception level that is higher than EL0 the exception is taken to the Exception level at which the instruction was executed.

  In all cases, the exception is generated only if the first instruction using the unaligned PC value is architecturally executed.

If the exception that results from a branch to an unaligned PC value:

- Is taken to an Exception level that is using AArch64, it is reported as a Misaligned PC exception, see *Exception from an Illegal Execution state, Misaligned PC, or Misaligned stack pointer* on page D1-1546.
- Is taken to an Exception level that is using AArch32, it is reported as a Prefetch Abort exception, see *Prefetch Abort exception reporting a Misaligned PC exception* on page G1-3819.

**Note**

Because bit[0] is used for interworking, it is impossible to specify a branch to A32 state when the bottom bit of the target address is 1. Therefore the bottom bit of IFAR, HIFAR, or FAR_ELx is 0 for all these cases.

### K1.1.6 Loads and Stores to unaligned locations

Some unaligned loads and stores in the ARMv7 architecture are described as UNPREDICTABLE. These are defined in the ARMv8-A architecture to do one of the following:

- Take an alignment fault.
- Perform the specified load or store to the unaligned memory location.

Non-Confidential - Beta

### K1.1.7 CONSTRAINED UNPREDICTABLE instructions in an IT block

A number of instructions in the architecture are described as being CONSTRAINED UNPREDICTABLE either:

- Anywhere within an IT block.
- As an instruction within an IT block, other than the last instruction within an IT block.

Unless otherwise stated in this manual, when these instructions are committed for execution, one of the following occurs:

- An UNDEFINED exception results.
- The instructions are executed as if they had passed the Condition code check.
- The instructions execute as NOPs. This means that they behave as if they had failed the Condition code check.

The behavior might in some implementations vary from instruction to instruction, or between different instances of the same instruction.

Many instructions that are CONSTRAINED UNPREDICTABLE in an IT block are branch instructions or other non-sequential instructions that change the PC. Where these instructions are not treated as UNDEFINED within an IT block, the remaining iterations of the PSTATE.IT state machine must be treated in one of the following ways:

- PSTATE.IT is cleared to 0.
- PSTATE.IT advances for either a sequential or a nonsequential change of the PC in the same way as it does for instructions that are not CONSTRAINED UNPREDICTABLE that cause a sequential change of the PC.

**Note**

This does not apply to an instruction that is the last instruction in an IT block.

The instructions addressed by the updated PC must do one of the following:

- Execute as if they had passed the Condition code check for the remaining iterations of the PSTATE.IT state machine.
- Execute as NOPs. That is, they behave as if they had failed the Condition code check for the remaining iterations of the PSTATE.IT state machine.
- Execute as if they were unconditional, or, if the instructions are part of another IT block, in accordance with the behavior described in *Branching into an IT block* on page K1-5424.

The behavior might in some implementations vary from instruction to instruction, or between different instances of the same instruction.

For exception returns or Debug state exits that cause PSTATE.IT to be set to a reserved value in T32 state or that return to A32 state with a nonzero value in PSTATE.IT, the PSTATE.IT bits are forced to '00000000'.

The reserved values are:

```
PSTATE.IT[7:4] != '0000' && PSTATE.IT[3:0] = '0000'
PSTATE.IT[2:0] != '000' when SCTLR/SCTLR_EL_1.ITD == '1'
```

Exception returns or Debug state exits that set PSTATE.IT to a non-reserved value in T32 state can occur when the flow of execution returns to a point:

- Outside an IT block, but with the PSTATE.IT bits set to a value other than '00000000'.
- Inside an IT block, but with a different value of the PSTATE.IT bits than if the IT block had been executed without an exception return or Debug state exit.

In this case the instructions at the target of the exception return or Debug state exit must do one of the following:

- Execute as if they passed the Condition code check for the remaining iterations of the PSTATE.IT state machine.
- Execute as NOPs. That is, they behave as if they failed the Condition code check for the remaining iterations of the PSTATE.IT state machine.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Execute as if they were unconditional, or as if the instruction were part of another IT block, in accordance with the behavior in *Branching into an IT block* on page K1-5424.

The remaining iterations of the PSTATE.IT state machine must behave in one of the following ways:

- The PSTATE.IT state machine advances as if it were in an IT block.
- The PSTATE.IT bits are ignored.
- The PSTATE.IT bits are forced to `'00000000'`.

### K1.1.8 Unallocated CP14 and CP15 instructions

In ARMv8-A, accesses to unallocated CP14 and CP15 register encodings are UNDEFINED.

This includes:

- Reads using encodings that are defined as WO.
- Writes using encodings that are defined as RO.
- `MCR` or `MRC` accesses to using a set of {`CRn`, `opc1`, `CRm`, `opc2`} values that the ARMv7 architecture defined as UNPREDICTABLE.
- CP14 or CP15 accesses that the ARMv7 architecture defined as UNPREDICTABLE when particular functionality was not implemented, when an implementation does not include the Exception level that provides that functionality in ARMv8.

### K1.1.9 SBZ or SBO fields in instructions

|Many of the A32 and T32 instructions have (0) or (1) in the instruction decode to indicate *should-be-zero*, SBZ, or *should-be-one*, SBO. Except for the specific cases called out in *CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instructions in the base instruction set* on page K1-5433, if the instruction bit pattern of an instruction is executed with these fields not having the *should be* values, one of the following must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction operates as if the bit had the *should-be* value.
- Any destination registers of the instruction become UNKNOWN.

The exceptions to this rule are:

- *LDM/LDMIA/LDMFD (T32)* on page K1-5437.
- *LDMDB/LDMEA* on page K1-5439.
- *LDR (literal)* on page K1-5440.
- *LDRB (literal)* on page K1-5442.
- *LDRH (literal)* on page K1-5447.
- *LDRSB (literal)* on page K1-5448.
- *LDRSH (literal)* on page K1-5450.
- *LDRD (immediate)* on page K1-5443.
- *LDRD (register)* on page K1-5444.
- *LDRD (literal)* on page K1-5444.
- *POP (T32)* on page K1-5452.
- *POP (A32)* on page K1-5452.
- *PUSH* on page K1-5453.
- *SDIV* on page K1-5456.
- *UDIV* on page K1-5477.
- *STM (STMIA, STMEA)* on page K1-5460.
- *STMDB (STMFD)* on page K1-5461.

Non-Confidential - Beta

### K1.1.10 Immediate constants in T32 data processing instructions

The immediate constants in the T32 data processing instructions describe immediate values generated by hw2[7:0] == 0000000 as being UNPREDICTABLE when

- Hw1[10] == 0 and hw2[14:12] == 001.
- Hw1[10] == 0 and hw2[14:12] == 010.
- Hw1[10] == 0 and hw2[14:12] == 011.

For the ARM architecture, these encodings produce the value `0b0000000`.

### K1.1.11 Reserved values in System and memory-mapped registers and translation table entries

Unless otherwise stated, all unallocated or reserved values of fields with allocated values within the AArch32 System registers, memory-mapped registers, and translation table entries behave in one of the following ways:

- The encoding maps onto any of the allocated values, but otherwise does not cause CONSTRAINED UNPREDICTABLE behavior.
- The encoding causes effects that could be achieved by a combination of more than one of the allocated encodings.
- The encoding causes the field to have no functional effect.

**Note**

These constraints are identical to those for the equivalent AArch64 definitions, as given in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5501.

### K1.1.12 CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values

The ARM architecture allows copies of control values or data values to be cached in a cache or TLB. This can lead to CONSTRAINED UNPREDICTABLE behavior if the cache or TLB has not been correctly invalidated following a change of the control or data values.

Unless explicitly stated otherwise, the behavior of the PE is consistent with:

- The old data or control value.
- The new data or control value.
- An amalgamation of the old and new data or control values.

**Note**

This rules applies where inadequate invalidation of the TLB might cause multiple hits within the TLB. In this situation, a failure to invalidate the TLB by code running at a given Privilege level must not make access to regions of memory with permissions or attributes that could not be accessed at that Privilege level possible.

Alternatively, an implementation might generate a Data Abort exception when detecting multiple hits within a TLB, using the TLB Conflict fault code.

The choice between these behaviors might, in some implementations, vary for each use of a control or data value.

### K1.1.13 CONSTRAINED UNPREDICTABLE behavior due to inadequate context synchronization

The ARM architecture requires that changes to System registers must be synchronized before they take effect. This can lead to CONSTRAINED UNPREDICTABLE behavior if the synchronization has not been performed.

In these cases, the behavior of the processor is consistent with the unsynchronized control value being either the old value or the new value.

Where multiple control values are updated but not yet synchronized, each control value might independently be the old value or the new value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

In addition, where the unsynchronized control value applies to different areas of functionality, or what an implementation has constructed as different areas of functionality, those areas might independently treat the control value as being either the old value or the new value.

The choice between these behaviors might, in some implementations, vary for each use of a control value.

### K1.1.14 Translation Table Base Address alignment

A misaligned Translation Table Base Address can occur if:

- The VMSAv8-32 Short-descriptor translation table format is enabled and TTBR0[13-N:7], which is defined to be RES0, contains one or more nonzero values.
- The VMSAv8-32 Long-descriptor translation table format is enabled, and TTBR0[x-1:3], TTBR1[x-1:3], HTTBR[x-1:3], or VTTBR[x-1:3], which are defined to be RES0, contain one or more nonzero values.

In the event of a misaligned Translation Table Base Address, one of the following behaviors must occur:

- The field that is defined to be RES0 is treated as if all bits were zero:
  - The value that is read back might be the value written or it might be zero.
- The calculation of an address for a translation table walk using that register might be corrupted in those bits that are nonzero.

### K1.1.15 Handling of conceptual coprocessors CP10 and CP11

The floating-point instruction set covers both of the conceptual coprocessors CP10 and CP11. This means that CPACR, HCPTR, and NSACR all have control bits whose naming reflects the {CP10, CP11} coprocessors. If these control bits differ, then the behavior is the same as if the control bit for CP11 were equal to the control bit for CP10 in all respects, other than the value read back by a direct read of the CP11 control bit. After a register write that writes different values to the CP10 and CP11 control bits, a direct read of the register might return an UNKNOWN value for the CP11 control bit.

**Note**

This means that, when different values are written to the CP10 and CP11 control bits in a single register, the architecture permits but does not require that a read of that register returns the value written to the CP11 control bit.

#### CONSTRAINED UNPREDICTABLE CPACR and NSACR settings

If CPACR.cp<n> contains the encoding `'10'`, then one of the following behaviors must occur:

- The encoding maps onto any of the allocated values, but otherwise does not cause UNPREDICTABLE behavior.
- The encoding causes effects that could be achieved by a combination of more than one of the allocated encodings.

**Note**

In ARMv7, CPACR had a D32DIS bit, and NSACR had an NSD32DIS bit. There is no CPACR.D32DIS or NSACR.NSD32DIS in ARMv8-A, and the corresponding bits in the two registers are RES0.

### K1.1.16 Performance Monitors Extension

The following subsections describe CONSTRAINED UNPREDICTABLE behaviors in AArch32 use of the Performance Monitors Extension:

- *CONSTRAINED UNPREDICTABLE accesses to PMXEVTYPER or PMXEVCNTR* on page K1-5429.
- *CONSTRAINED UNPREDICTABLE accesses to PMEVCNTR<n> and PMEVTYPER<n>* on page K1-5429.
- *CONSTRAINED UNPREDICTABLE behavior caused by HDCR.HPMN* on page K1-5430.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### CONSTRAINED UNPREDICTABLE accesses to PMXEVTYPER or PMXEVCNTR

The following cases can cause CONSTRAINED UNPREDICTABLE behavior:

- If PMSELR.SEL is not equal to 31, and PMSELR.SEL is greater than or equal to PMCR.N, and the PE is executing in Secure state or in Non-secure Hyp mode.
- If PMSELR.SEL is not 31, and PMSELR.SEL is greater than or equal to HDCR.HPMN, and the PE is executing in a Non-secure mode other than Hyp mode.

In these UNPREDICTABLE cases, one of the following behaviors must occur:

- Accesses to PMXEVTYPER or PMXEVCNTR from that mode are UNDEFINED.
- Accesses to PMXEVTYPER or PMXEVCNTR from that mode behave as RAZ/WI.
- Accesses to PMXEVTYPER or PMXEVCNTR from that mode execute as NOPs.
- Accesses to PMXEVTYPER or PMXEVCNTR from that mode behave as if PMSELR.SEL contains an UNKNOWN value that is less than the number of counters accessible at the current Exception level and Security state.
- Accesses to PMXEVTYPER or PMXEVCNTR behave as if PMSELR.SEL is 31.
- In Non-secure state, for an access to PMXEVTYPER or PMXEVCNTR from PL1 or a permitted access from PL0, if the counter is implemented but not accessible at the current Exception level, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of PMUSERENR.EN is 1.
  - EL1 is using AArch64 and the value of PMUSERENR_EL0.EN is 1.

If PMSELR.SEL is equal to 31, then one of the following behaviors must occur:

- Accesses to PMXEVCNTR are UNDEFINED.
- Accesses to PMXEVCNTR behave as RAZ/WI.
- Accesses to PMXEVCNTR execute as NOPs.
- Accesses to PMXEVCNTR behave as if PMSELR.SEL contains an UNKNOWN value that is less than the number of counters accessible at the current Exception level and Security state.
- In Non-secure state, for an access to PMXEVCNTR from PL1 or a permitted access from PL0, if the counter is implemented but not accessible at the current Exception level, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of PMUSERENR.EN is 1.
  - EL1 is using AArch64 and the value of PMUSERENR_EL0.EN is 1.

**Note**

In an implementation that includes EL2, in Non-secure state at PL0 and PL1, HDCR.HPMN, or MDCR_EL2.HPMN, identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

### CONSTRAINED UNPREDICTABLE accesses to PMEVCNTR<n> and PMEVTYPER<n>

If <n> is greater than the number of counters available in the current Exception level and state, reads and writes of PMEVCNTR<n> and PMEVTYPER<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- In Non-secure state, for an access to PMEVCNTR<n> or PMEVTYPER<n> from PL1 or a permitted access from PL0, if the counter is implemented but not accessible at the current Exception level, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of PMUSERENR.EN is 1.
  - EL1 is using AArch64 and the value of PMUSERENR_EL0.EN is 1.

**Note**

In an implementation that includes EL2, in Non-secure state at PL0 and PL1, HDCR.HPMN, or MDCR_EL2.HPMN, identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

#### CONSTRAINED UNPREDICTABLE behavior caused by HDCR.HPMN

If HDCR.HPMN is set to 0 or to a value greater than PMCR.N, then the CONSTRAINED UNPREDICTABLE behavior is:

- The value returned by a direct read of HDCR.HPMN is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 use. That is, the PE behaves as if HDCR.HPMN is set to an UNKNOWN non-zero value less than PMCR.N.
  - All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

### K1.1.17 Syndrome register handling for CONSTRAINED UNPREDICTABLE instructions treated as UNDEFINED

When a CONSTRAINED UNPREDICTABLE instruction is treated as UNDEFINED, this generates an exception:

- If this exception is taken to an Exception level that is using AArch64 then ESR_ELx is UNKNOWN.
- If this exception is taken to EL2 and EL2 is using AArch32, then the HSR is UNKNOWN.

**Note**

The value written to ESR or HSR must be consistent with a value that could be created as the result of an exception from the same Exception level that generated the exception, but resulted from a situation that is not CONSTRAINED UNPREDICTABLE at that Exception level. This is to avoid a possible privilege violation.

### K1.1.18 Out of range virtual address

If the PE executes an instruction for which the instruction address, size, and alignment mean it contains the bytes `0xFFFF FFFF` and `0x0000 0000`, then the bytes that wrap around and appear to be from `0x0000 0000` onwards come from an UNKNOWN address.

If the PE executes a load or store instruction for which the computed address, total access size, and alignment mean it accesses bytes `0xFFFF FFFF` and `0x0000 0000`, then the bytes that wrap around and appear to be from `0x0000 0000` onwards come from an UNKNOWN address.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### K1.1.19 Instruction fetches from Device memory

Instruction fetches from Device memory are CONSTRAINED UNPREDICTABLE.

If a location in memory has the Device attribute and is not marked as execute-never, then an implementation might perform speculative instruction accesses to this memory location when address translation is enabled.

If a branch causes the program counter to point to a location in memory with the Device attribute that is not marked as execute-never for the current Exception level for instruction fetches, then an implementation must perform one of the following behaviors:

- It treats the instruction fetch as if it were to a memory location with the Normal, Non-cacheable attribute.
- It generates a Permission fault.

### K1.1.20 Multi-access instructions that load the PC from Device memory

Multi-access instructions that load the PC from Device memory when address translation is enabled are UNPREDICTABLE in AArch32 state. In the ARMv8-A architecture in AArch32, an implementation must perform one of the following behaviors:

- It loads the PC from the memory location as if the memory location had the Normal Non-cacheable attribute.
- It generates a permission fault.

### K1.1.21 Programming CSSELR.Level for a cache level that is not implemented

If CSSELR.Level is programmed to a cache level that is not implemented, then a read of CSSELR returns an UNKNOWN value in CSSELR.Level.

If the CSSELR.Level is programmed to a cache level that is not implemented, then on a read of CCSIDR an implementation must perform one of the following behaviors:

- The CCSIDR read executes as a `NOP`.
- The CCSIDR read is UNDEFINED.
- The CCSIDR read returns an UNKNOWN value.

### K1.1.22 Crossing a page boundary with different memory types or Shareability attributes

A memory access from a load or store instruction that crosses a page boundary to a memory location that has a different memory type or Shareability attribute results in CONSTRAINED UNPREDICTABLE behavior. In this case, the implementation must perform one of the following behaviors:

- All memory accesses generated by the instruction use the memory type and Shareability attributes associated with the first address accessed by the instruction.
- All memory accesses generated by the instruction use the memory type and Shareability attributes associated with the last address accessed by the instruction.
- Each memory access generated by the instruction uses the memory type and Shareability attribute associated with its own address.
- The instruction generates an alignment fault caused by the memory type.

  For the Non-secure PL1&0 translation regime:

  — If the stage 1 translation causes the mismatch then the resulting exception is taken to PL1.

  — If the stage 2 translation causes the mismatch then the resulting exception is taken to PL2.

  — If both stages of translation cause the mismatch then the resulting exception can be taken to either PL1 or PL2.
- The instruction executes as a `NOP`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### K1.1.23 Crossing a 4KB boundary with a Device access

A memory access from a load or store instruction to Device memory that crosses a 4KB boundary results in CONSTRAINED UNPREDICTABLE behavior. In this case, the implementation must perform one of the following behaviors:

- All memory accesses generated by the instruction are performed as if the presence of the boundary had no effect on the memory accesses.
- All memory accesses generated by the instruction are performed as if the presence of the boundary had no effect on the memory accesses, except that there is no guarantee of ordering between memory accesses.
- The instruction generates an Alignment fault caused by the memory type.

  For the Non-secure PL1&0 translation regime:

  — If the stage 1 translation causes the boundary to be crossed then the resulting exception is taken to PL1.

  — If the stage 2 translation causes the boundary to be crossed then the resulting exception is taken to PL2.

  — If both stages of translation cause the boundary to be crossed then the resulting exception can be taken to either PL1 or PL2.
- The instruction executes as a `NOP`.

**Note**

The boundary referred to is between two Device memory regions that are both of 4KB and aligned to 4KB.

### K1.1.24 CONSTRAINED UNPREDICTABLE behavior for memory hints, Advanced SIMD instructions, and miscellaneous A32 instructions

A number of memory hints, Advanced SIMD instructions, and miscellaneous A32 instructions can result in CONSTRAINED UNPREDICTABLE behavior.

If an instructions listed in *Unconditional instructions* on page F4-2541 is CONSTRAINED UNPREDICTABLE but does not have an encoding of `Op1= 101x001`, `Op2 = -`, and `Rn = 1111`, then an implementation must treat these encodings in one of the following ways:

- The encoding is UNDEFINED.
- The instruction executes as a `NOP`.

When `Op1= 101x001`, `Op2 = -`, and `Rn = 1111`, *PLD (literal)* on page F6-2868 describes the behavior. This encoding is subject to the rules outlined in *SBZ or SBO fields in instructions* on page K1-5426.

### K1.1.25 Out of range values of the Set/Way/Index fields in cache maintenance instructions

In the cache maintenance by set/way instructions DCCISW, DCCSW, and DCISW, if any set/way/index argument is larger than the value supported by the implementation, then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:

  — No cache lines.

  — A single arbitrary cache line.

  — Multiple arbitrary cache lines.

**Note**

This CONSTRAINED UNPREDICTABLE behavior applies, also, to the A64 cache maintenance by set/way instructions DC CISW, DC CSW, and DC ISW.

## K1.1.26 CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instructions in the base instruction set

This section lists the CONSTRAINED UNPREDICTABLE behavior for the different A32 and T32 instructions listed in *Alphabetical list of T32 and A32 base instruction set instructions* on page F6-2576.

**Note**

- The pseudocode used in this section to describe cases that can result in CONSTRAINED UNPREDICTABLE behavior does not necessarily match the encoding specific pseudocode for a specific instruction.
- If an instruction can result in CONSTRAINED UNPREDICTABLE behavior that is not specific to that particular instruction, see the relevant section in this appendix for a description of the CONSTRAINED UNPREDICTABLE behavior.

### BFC

For a description of these instructions and the encodings, see *BFC* on page F6-2626.

#### *CONSTRAINED UNPREDICTABLE behavior*

If `msbit < lsbit`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The output value in the registers is UNKNOWN.

### BFI

For a description of these instructions and the encodings, see *BFI* on page F6-2628.

#### *CONSTRAINED UNPREDICTABLE behavior*

If `msbit < lsbit`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The output value in the registers is UNKNOWN.

### BKPT

For a description of this instruction and the encoding, see *BKPT* on page F6-2637.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `cond != '1110' && cond != '1111'`, then one of the following behaviors occurs:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction executes unconditionally.
  - The instruction executes conditionally.

For the treatment of the case where `cond == '1111'` see *CONSTRAINED UNPREDICTABLE behavior for memory hints, Advanced SIMD instructions, and miscellaneous A32 instructions* on page K1-5432.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## CLZ

For a description of this instruction and the encoding, see *CLZ* on page F6-2650.

### *CONSTRAINED UNPREDICTABLE behavior*

For the T1 encoding:

- If `!consistent(Rm)`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The register specified by hw1[3:0] is used as the source register.
  - The register specified by hw2[3:0] is used a the source register.
  - The value in the destination register is UNKNOWN.

## CMP (register)

For a description of this instruction and the encoding, see *CMP (register)* on page F6-2658.

### *CONSTRAINED UNPREDICTABLE behavior*

For the T2 encoding:

- If `n < 8 && m < 8`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the comparison between Rn and Rm.
  - The condition flags become UNKNOWN.

## CRC32, CRC32C

For a description of this instruction and the encoding, see *CRC32* on page F6-2665 and *CRC32C* on page F6-2667.

### *CONSTRAINED UNPREDICTABLE behavior*

If `size == 64`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction behaves as if `sz == '10'`.

For the A1 encoding:

- If `cond != '1110'`, then one of the following behaviors must occur:
- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction is executed unconditionally.
- The instruction is executed conditionally.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## HLT

For a description of this instruction and the encoding, see *HLT* on page F6-2685.

### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `cond != '1110' && cond != '1111'`, then one of the following behaviors occurs:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction is executed unconditionally.
  - The instruction is executed conditionally.

For the treatment of the case where `cond == '1111'` see *CONSTRAINED UNPREDICTABLE behavior for memory hints, Advanced SIMD instructions, and miscellaneous A32 instructions* on page K1-5432.

## IT

For a description of this instruction and the encoding, see *IT* on page F6-2690.

### *CONSTRAINED UNPREDICTABLE behavior*

For the T1 encoding:

- If `firstcond == '1111'||(firstcond == '1110' && BitCount(mask)!= 1)` then one of the following behaviors occurs:
  - The instruction is undefined.
  - The instruction executes as a `NOP`.
  - `firstcond == '1111'` is treated the same as `firstcond` == '1110', meaning the always condition, and the PSTATE.IT state machine is progressed in the same way as for any other `cond_base` value.

## LDAEX

For a description of this instruction and the encoding, see *LDAEX* on page F6-2694.

### *CONSTRAINED UNPREDICTABLE behavior*

If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

## LDAEXB

For a description of this instruction and the encoding, see *LDAEXB* on page F6-2696.

### *CONSTRAINED UNPREDICTABLE behavior*

If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

## LDAEXD

For a description of this instruction and the encoding, see *LDAEXD* on page F6-2698.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For the T1 encoding:

- If `t == t2`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.

For the A1 encoding:

- If `Rt<0>=='1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The behavior is the same as if the `Rt<0>=='0'`.
  - The registers accessed are both specified by Rt. This means that Rt and Rt+1 are the same, and both have bit[0] == 1.
  - The registers accessed are specified by Rt and Rt+1.

**Note**

If `t2 == 15`, then the requirements described in *Using R15* on page K1-5423 apply.

## LDAEXH

For a description of this instruction and the encoding, see *LDAEXH* on page F6-2700.

### *CONSTRAINED UNPREDICTABLE behavior*

If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

## LDC/LDC2 (literal)

For a description of this instruction and the encoding, see *LDC, LDC2 (literal)* on page F6-2708.

### *CONSTRAINED UNPREDICTABLE behavior*

If `W == '1' || (P == '0' && CurrentInstrSet() != InstrSet_ARM)`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The load instruction operates without writeback.

  **Note**

  This is consistent with ignoring writes to the PC.

- The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, see *Using R15* on page K1-5423.

## LDM/LDMIA/LDMFD (A32)

For a description of this instruction and the encoding, see *LDM, LDMIA, LDMFD* on page F6-2711.

### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `BitCount(registers) < 1`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as an `LDM` with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.
- If `wback && registers<n> == '1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the loads using the specified addressing mode, and the content of the register being written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

## LDM/LDMIA/LDMFD (T32)

For a description of this instruction and the encoding, see *LDM, LDMIA, LDMFD* on page F6-2711.

### *CONSTRAINED UNPREDICTABLE behavior*

For the T1 encoding:

- If `BitCount(registers) < 1`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as an `LDM` with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

For the T2 encoding:

- If `BitCount(registers) < 2`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction loads a single register using the specified addressing modes.
  - The instruction operates as an `LDM` with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.
- If hw2[13] is set to 1, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the loads using the specified addressing mode, but R13 is UNKNOWN.

    **Note**

    This is an exception to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- If `P == '1' && M == '1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these registers.
- If `wback && registers<n> == '1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the loads using the specified addressing mode, and the content of the register being written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

## LDMDA/LDMFA

For a description of this instruction and the encoding, see *LDMDA, LDMFA* on page F6-2718.

### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `BitCount(registers) < 1`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as an `LDM` with the same addressing mode, but targeting an unspecified set of registers. These registers might include R15.
- If `wback && registers<n> == '1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

## LDMIB/LDMED

For a description of this instruction and the encoding, see *LDMIB, LDMED* on page F6-2722.

### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `BitCount(registers) < 1`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as an `LDM` with the same addressing mode, but targeting an unspecified set of registers. These registers might include R15.
- If `wback && registers<n> == '1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

Non-Confidential - Beta

## LDMDB/LDMEA

For a description of this instruction and the encoding, see *LDMDB, LDMEA* on page F6-2720.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `wback && registers<n> == '1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

For the A1 encoding:

- If `BitCount(registers) < 1`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED
  - The instruction executes as a `NOP`.
  - The instruction operates as an `LDM` with the same addressing mode, but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

For the T1 encoding:

- If `BitCount(registers) < 2`, one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction loads a single register using the specified addressing modes.
  - The instruction operates as an `LDM` with the same addressing mode, but targeting an unspecified set of registers. These registers might include R15.
- If hw2[13] is set to 1, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the loads using the specified addressing mode, but R13 is UNKNOWN.

  **Note**

  This is an exception to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426.
- If `P == '1' && M == '1'`, then one of the following behaviors must occur:
  - The instruction is undefined.
  - The instruction executes as a `NOP`.
  - The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these registers.

### LDR (immediate, A32)

For a description of this instruction and the encoding, see *LDR (immediate)* on page F6-2724.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

### LDR (immediate, T32)

For a description of this instruction and the encoding, see *LDR (immediate)* on page F6-2724.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the T4 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

### LDR (literal)

For a description of this instruction and the encoding, see *LDR (literal)* on page F6-2728.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If bit[24] has the same value as bit[21]:
  - The instruction is UNDEFINED.
  - The instruction is treated as a `NOP`.
  - The instruction is treated as if bit[24] had value of 1 and bit[21] had a value of 0.
  - The instruction treats bit[24] as the P bit, and bit[21] as the writeback bit, and uses the same addressing mode as described in the immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

    **Note**

    This is an exception to the principle in *SBZ or SBO fields in instructions* on page K1-5426.

- If bit[24] == 0 and bit[21] == 1, then the instruction can be handled according to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426 or the requirements described in *LDR (immediate, T32)*.

Non-Confidential - Beta

### LDR (register, A32)

For a description of this instruction and the encoding, see *LDR (register)* on page F6-2730.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

### LDRB (immediate, A32)

For a description of this instruction and the encoding, see *LDRB (immediate)* on page F6-2733.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

### LDRB (immediate, T32)

For a description of this instruction and the encoding, see *LDRB (immediate)* on page F6-2733.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the T3 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### LDRB (literal)

For a description of this instruction and the encoding, see *LDRB (literal)* on page F6-2736.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If bit[24] has the same value as bit[21]:
  - The instruction is UNDEFINED.
  - The instruction is treated as a `NOP`.
  - The instruction is treated as if bit[24] had value of 1 and bit[21] had a value of 0.
  - The instruction treats bit[24] as the P bit, and bit[21] as the writeback bit, and uses the same addressing mode as described in the immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

    **Note**

    This is an exception to the principle in *SBZ or SBO fields in instructions* on page K1-5426.

- If bit[24] == 0 and bit[21] == 1, then the instruction can be handled according to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426 or the requirements described in *LDRB (immediate, T32)* on page K1-5441.

### LDRB (register)

For a description of this instruction and the encoding, see *LDRB (register)* on page F6-2738.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

### LDRBT

For a description of this instruction and the encoding, see *LDRBT* on page F6-2740.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 and A2 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

- When the Rn field specifies R15, then this instruction can be treated either as described in this section or as described in *LDRB (literal)* on page K1-5442.

## LDRD (immediate)

For a description of this instruction and the encoding, see *LDRD (immediate)* on page F6-2742.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `wback && (n == t || n == t2)`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

For the T1 encoding:

- If `t == t2`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.

For the A1 encoding:

- If `P=='0' && W=='1'` then one of the following behaviors must occurs:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction behaves as if the values of P and W were as follows:

    `P == '1' && W == '0'`

    `P == '1' && W == '1'`

    `P == '0' && W == '0'`

- If `Rt<0>=='1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The behavior is the same as if `Rt<0> =='0'`.
  - The register accessed are both specified by Rt. This means that Rt and Rt+1 are the same, and both have bit[0] == 1.
  - The registers accessed are specified by Rt and Rt+1.

    **Note**

    This does not apply if `Rt=='1111'`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## LDRD (literal)

For a description of this instruction and the encoding, see *LDRD (literal)* on page F6-2744.

### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If bit[24] and bit[21] do not have their *should be* values, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction is treated as if the bits had their *should be* values.
- If `Rt<0>=='1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The behavior is the same as if `Rt<0> =='0'`.
  - The registers accessed are both specified by Rt. This means that Rt and Rt+1 are the same, and both have bit[0] equal to 1.
  - The registers accessed are specified by Rt and Rt+1.

    **Note**

    This does not apply if `Rt=='1111'`.

For the T1 encoding:

- If `t == t2`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.
- If `W == '1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction is treated as if `W == '0'`.
  - The instruction uses the P and W bits as described for *LDRD (immediate)* on page K1-5443.

## LDRD (register)

For a description of this instruction and the encoding, see *LDRD (register)* on page F6-2746.

### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `wback && (n == t || n == t2)`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- If `P == '0' && W == '1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction behaves as if the values of P and W were as follows:

    `P == '1' && W == '0'`

    `P == '1' && W == '1'`

    `P == '0' && W == '0'`
- If `m == t || m ==t2`, then one of the following behaviors must occur;
  - The instruction is UNDEFINED.
  - The instruction is treated as a `NOP`.
  - The instruction loads register Rm with an UNKNOWN value.
- If `Rt<0>=='1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The behavior is the same as if `Rt<0> == '0'`.
  - The registers accessed are both specified by Rt. This means that Rt and Rt+1 are the same, and in both cases bit[0] == 1.
  - The registers accessed are specified by Rt and Rt+1.

    **Note**

    This does not apply if `Rt=='1111'`.

## LDREX

For a description of this instruction and the encoding, see *LDREX* on page F6-2748.

### *CONSTRAINED UNPREDICTABLE behavior*

If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

## LDREXB

For a description of this instruction and the encoding, see *LDREXB* on page F6-2750.

### *CONSTRAINED UNPREDICTABLE behavior*

If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## LDREXD

For a description of this instruction and the encoding, see *LDREXD* on page F6-2752.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

For the T1 encoding:

- If `t == t2`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.

For the A1 encoding:

- If `Rt<0>=='1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The behavior is the same as if the `Rt<0>=='0'`.
  - The registers accessed are both specified by Rt. This means that Rt and Rt+1 are the same, and both have bit[0] == 1.
  - The registers accessed are specified by Rt and Rt+1.

**Note**

If `t2 == 15`, then the requirements described in *Using R15* on page K1-5423 apply.

## LDREXH

For a description of this instruction and the encoding, see *LDREXH* on page F6-2754.

### *CONSTRAINED UNPREDICTABLE behavior*

If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

## LDRH (immediate, A32)

For a description of this instruction and the encoding, see *LDRH (immediate)* on page F6-2756.

### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## LDRH (immediate, T32)

For a description of this instruction and the encoding, see *LDRH (immediate)* on page F6-2756.

### *CONSTRAINED UNPREDICTABLE behavior*

For the T3 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

## LDRH (literal)

For a description of this instruction and the encoding, see *LDRH (literal)* on page F6-2759.

### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If bit[24] has the same value as bit[21]:
  - The instruction is UNDEFINED.
  - The instruction is treated as a `NOP`.
  - The instruction is treated as if bit[24] had value of 1 and bit[21] had a value of 0.
  - The instruction treats bit[24] as the P bit, and bit[21] as the writeback bit, and uses the same addressing mode as described in the immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

    **Note**

    This is an exception to the principle in *SBZ or SBO fields in instructions* on page K1-5426.

- If bit[24] == 0 and bit[21] == 1, then the instruction can be handled according to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426 or the requirements described in *LDRH (immediate, T32)*.

## LDRH (register)

For a description of this instruction and the encoding, see *LDRH (register)* on page F6-2761.

### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### LDRHT

For a description of this instruction and the encoding, see *LDRHT* on page F6-2763.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 and A2 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

When the Rn field specifies R15, then this instruction can be treated either as described in this section or as described in *LDRH (literal)* on page K1-5447.

### LDRSB (immediate)

For a description of this instruction and the encoding, see *LDRSB (immediate)* on page F6-2765.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 and T2 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

### LDRSB (literal)

For a description of this instruction and the encoding, see *LDRSB (literal)* on page F6-2768.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If bit[24] has the same value as bit[21]:
  - The instruction is UNDEFINED.
  - The instruction is treated as a `NOP`.
  - The instruction is treated as if bit[24] had value of 1 and bit[21] had a value of 0.
  - The instruction treats bit[24] as the P bit, and bit[21] as the writeback bit, and uses the same addressing mode as described in the immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

    **Note**

    This is an exception to the principle in *SBZ or SBO fields in instructions* on page K1-5426.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- If bit[24] == 0 and bit[21] == 1, then the instruction can be handled according to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426 or the requirements described in *LDRSB (immediate)* on page K1-5448.

### LDRSB (register)

For a description of this instruction and the encoding, see *LDRSB (register)* on page F6-2770.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `wback && (n == t)`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

### LDRSBT

For a description of this instruction and the encoding, see *LDRSBT* on page F6-2772.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 and A2 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

When the Rn field specifies R15, then this instruction can be treated either as described in this section or as described in *LDRSB (literal)* on page K1-5448.

### LDRSH (immediate)

For a description of this instruction and the encoding, see *LDRSH (immediate)* on page F6-2774.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the T2 and A1 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

## LDRSH (literal)

For a description of this instruction and the encoding, see *LDRSH (literal)* on page F6-2777.

### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If bit[24] has the same value as bit[21]:
  - The instruction is UNDEFINED.
  - The instruction is treated as a `NOP`.
  - The instruction is treated as if bit[24] had value of 1 and bit[21] had a value of 0.
  - The instruction treats bit[24] as the P bit, and bit[21] as the writeback bit, and uses the same addressing mode as described in the immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

    **Note**

    This is an exception to the principle in *SBZ or SBO fields in instructions* on page K1-5426.

- If bit[24] == 0 and bit[21] == 1, then the instruction can be handled according to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426 or the requirements described in *LDRSH (immediate)* on page K1-5449.

## LDRSH (register)

For a description of this instruction and the encoding, see *LDRSH (register)* on page F6-2779.

### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

## LDRSHT

For a description of this instruction and the encoding, see *LDRSHT* on page F6-2781.

For the A1 and A2 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

When the Rn field specifies R15, then this instruction can be treated either as described in this section or as described in *LDRSB (literal)* on page K1-5448.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### LDRT

For a description of this instruction and the encoding, see *LDRT* on page F6-2783.

For the A1 and A2 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

When the Rn field specifies R15, then this instruction can be treated either as described in this section or as described in *LDRSB (literal)* on page K1-5448.

### MOV (register, T32)

For a description of this instruction and the encoding, see *MOV, MOVS (register)* on page F6-2813.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the T2 encoding:

- If `InITBlock()`, then one of the following behaviors must occur:
  - The instruction generates an UNDEFINED exception.
  - The instruction is executed as if it passed its condition code check.
  - The instruction executes as a `NOP`. That is, it behaves as if it failed its condition code check.
  - The instruction is treated as MOV Rd, Rm.

**Note**

This is an exception to the general behavior described in *CONSTRAINED UNPREDICTABLE instructions in an IT block* on page K1-5425.

### MRRC, MRRC2

For a description of this instruction and the encoding, see *MRRC, MRRC2* on page F6-2828.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `t == t2`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The register that is transferred takes an UNKNOWN value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### MSR (register)

For a description of this instruction and the encoding, see *MSR (register)* on page F6-2840.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `mask == '00'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.

### POP (A32)

For a description of this instruction and the encoding, see *POP* on page F6-2877.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If bit[13] is set to 1, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the loads using the specified addressing mode but R13 is UNKNOWN.

For the A2 encoding:

- If `t == 13`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the load using the specified addressing mode but R13 is UNKNOWN.

  **Note**

  This is an exception to the requirements described in *Using R13* on page K1-5423.

### POP (T32)

For a description of this instruction and the encoding, see *POP* on page F6-2877.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the T1 encoding:

- If `BitCount(registers) < 1`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as a `POP` with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For the T2 encoding:

- If `BitCount(registers) < 2`, one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction loads a single register using the specified addressing modes.
  - The instruction operates as an `LDM` with the same addressing mode but targeting an unspecified set of registers. These might include R15.
- If hw2 bit[13] is set to 1, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the loads using the specified addressing mode but R13 is UNKNOWN.

    **Note**

    This is an exception to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426.
- If `P == '1' && M == '1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these registers.

For the T3 encoding:

- If `t == 13`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the load using the specified addressing mode but R15 is UNKNOWN.

  **Note**

  This is an exception to the requirements described in *Using R13* on page K1-5423.

## PUSH

For a description of this instruction and the encoding, see *PUSH* on page F6-2883.

### *CONSTRAINED UNPREDICTABLE behavior*

For the T1 encoding:

- If `BitCount(registers) < 1`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as a `PUSH` with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For the T2 encoding:

- If `BitCount(registers) < 2`, one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction stores a single register using the specified addressing modes.
  - The instruction operates as a `PUSH` with the same addressing mode but targeting an unspecified set of registers. These might include R15.
- If hw2 bit[13] is set, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the stores using the specified addressing mode but R13 is UNKNOWN.

    **Note**

    This is an exception to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426.
- If hw2 bit[15] is set to 1, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the stores using the specified addressing mode, but R15 is UNKNOWN.

    **Note**

    This is an exception to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426.

## RBIT

For a description of this instruction and the encoding, see *RBIT* on page F6-2907.

### *CONSTRAINED UNPREDICTABLE behavior*

For the T1 encoding:

- If `! Consistent(Rm)`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The register specified by Rm in halfword 1 is used as the source register.
  - The register specified by Rm in halfword 2] is used as the source register.
  - The value in the destination register is UNKNOWN.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### REV

For a description of this instruction and the encoding, see *REV* on page F6-2909.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the T2 encoding:

- If ! `Consistent(Rm)`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The register specified by Rm in halfword 1 is used as the source register.
  - The register specified by Rm in halfword 2 is used as the source register.
  - The value in the destination register is UNKNOWN.

### REV16

For a description of this instruction and the encoding, see *REV16* on page F6-2911.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the T2 encoding:

- If ! `Consistent(Rm)`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The register specified by Rm in halfword 1 is used as the source register.
  - The register specified by Rm in halfword 2 is used as the source register.
  - The value in the destination register is UNKNOWN.

### REVSH

For a description of this instruction and the encoding, see *REVSH* on page F6-2913.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the T2 encoding:

- If ! `Consistent(Rm)`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The register specified by Rm in halfword 1 is used as the source register.
  - The register specified by Rm in halfword 2 is used as the source register.
  - The value in the destination register is UNKNOWN.

### SBFX

For a description of this instruction and the encoding, see *SBFX* on page F6-2956.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `msbit > 31`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The output value in the register is UNKNOWN.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### SDIV

For a description of this instruction and the encoding, see *SDIV* on page F6-2958.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the T1encoding:

- If hw2 bits[15:12] !='1111', then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs a divide with no side-effects on other registers.
  - The instruction performs a divide and the register specified by bits[15:12] becomes UNKNOWN.

  **Note**

  This is an exception to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426.

For the A1 encoding:

- If bits[15:12] !='1111', then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs a divide with no side-effects on other registers.
  - The instruction performs a divide and the register specified by bits[15:12] becomes UNKNOWN.

  **Note**

  This is an exception to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426.

### SMLAL

For a description of this instruction and the encoding, see *SMLAL, SMLALS* on page F6-2985.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If dHi == dLo, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register takes an UNKNOWN value.

### SMLALBB, SMLALBT, SMLALTB, SMLALTT

For a description of this instruction and the encoding, see *SMLALBB, SMLALBT, SMLALTB, SMLALTT* on page F6-2987.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If dHi == dLo, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register takes an UNKNOWN value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### SMLALD

For a description of this instruction and the encoding, see *SMLAD, SMLADX* on page F6-2983.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `dHi == dLo`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The destination register takes an UNKNOWN value.

### SMLSLD

For a description of this instruction and the encoding, see *SMLSD, SMLSDX* on page F6-2993.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `dHi == dLo`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The destination register takes an UNKNOWN value.

### SMULL

For a description of this instruction and the encoding, see *SMULL, SMULLS* on page F6-3007.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `dHi == dLo`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The destination register takes an UNKNOWN value.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### STC, STC2

For a description of this instruction and the encoding, see *STC, STC2* on page F6-3026.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `n == 15 && (wback || CurrentInstrSet() != InstrSet_A32)`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction operates without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.

  - The instruction set uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

**Note**

Use of R15 by the T32 `STC` instruction is also covered by *Using R15* on page K1-5423.

### STLEX

For a description of this instruction and the encoding, see *STLEX* on page F6-3032.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction executes, but the value stored is UNKNOWN.
- If `d == n`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store to an UNKNOWN address.
- If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.
- If the instruction specifies that `t2==15`, then the requirements described in *Using R15* on page K1-5423 apply.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## STLEXB

For a description of this instruction and the encoding, see *STLEXB* on page F6-3034.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction executes, but the value stored is UNKNOWN.
- If `d == n`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store to an UNKNOWN address.
- If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.
- If the instruction specifies that `t2==15`, then the requirements described in *Using R15* on page K1-5423 apply.

## STLEXD

For a description of this instruction and the encoding, see *STLEXD* on page F6-3036.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction executes, but the value stored is UNKNOWN.
- If `d == n`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store to an UNKNOWN address.
- If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.
- If the instruction specifies that `t2==15`, then the requirements described in *Using R15* on page K1-5423 apply.

For the A1 encoding:

- If `Rt<0>=='1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The behavior is the same as if `Rt<0>=='0'`.
  - The register accessed are both specified by Rt. For example, Rt and Rt+1 are the same, and both have bit[0] == 1.
  - The registers accessed are specified by Rt and R+1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## STLEXH

For a description of this instruction and the encoding, see *STLEXH* on page F6-3038.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction executes, but the value stored is UNKNOWN.
- If `d == n`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store to an UNKNOWN address.
- If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.
- If the instruction specifies that `t2==15`, then the requirements described in *Using R15* on page K1-5423 apply.

## STM (STMIA, STMEA)

For a description of this instruction and the encoding, see *STM, STMIA, STMEA* on page F6-3041.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

For the T1 and A1 encoding:

- If `BitCount(registers) < 1`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as an `STM` with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

For the T2 encoding:

- If `BitCount(registers) < 2`, then one of the following behaviors occurs:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction stores a single register using the specified addressing modes.
  - The instruction operates as an `STM` with the same addressing mode but targeting an unspecified set of registers. These might include R15.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- If hw2 bit[13] is set, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the stores using the specified addressing mode but the value of R13 is UNKNOWN.

  **Note**

  This is an exception to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426.

- If hw2 bit[15] is set to 1, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the stores using the specified addressing mode but the value of R15 is UNKNOWN.

  **Note**

  This is an exception to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426.

- If `wback && registers<n> == '1'`, and that case is defined to be UNPREDICTABLE, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the stores using the specified addressing mode and the value stored for the base register is UNKNOWN.

## STMDB (STMFD)

For a description of this instruction and the encoding, see *STMDB, STMFD* on page F6-3047.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

For the A1 encoding:

- If `BitCount(registers) < 1`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

For the T1 encoding:

- If `BitCount(register) < 2`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction stores a single register using the specified addressing mode.
  - The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These might include R15.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- If `wback && registers<n> == '1'`, and that case is defined to be UNPREDICTABLE, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the stores using the specified addressing mode and the value stored for the base register is UNKNOWN.
- If hw2 bit[13] is set to 1, then one of the following behaviors occurs:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the stores using the specified addressing mode but the value of R13 is UNKNOWN.

    **Note**

    This an exception to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426.
- If hw2 bit[15] is set to 1, then one of the following behaviors occurs:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all of the stores using the specified addressing mode but the value of R15 is UNKNOWN.

    **Note**

    This is an exception to the requirement described in *SBZ or SBO fields in instructions* on page K1-5426.

## STMDA (STMED)

For a description of this instruction and the encoding, see *STMDA, STMED* on page F6-3045.

### *CONSTRAINED UNPREDICTABLE behavior*

For the A1encoding:

- If `BitCount(registers) < 1`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as an `STM` with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.
- If the instruction uses R15 as a base register and specifies writeback, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction is performed without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.
  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

### STMIB (STMFA)

For a description of this instruction and the encoding, see *STMIB, STMFA* on page F6-3049.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `BitCount(registers) < 1`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as an `STM` with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.
- If the instruction uses R15 as a base register and specifies writeback, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction is performed without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.

  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.
- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

### STR (immediate, A32)

For a description of this instruction and the encoding, see *STR (immediate)* on page F6-3051.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1encoding:

- If `t == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.
- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- If `wback && n == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction operates without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.

  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

### STR (immediate, T32)

For a description of this instruction and the encoding, see *STR (register)* on page F6-3055.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the T3 encoding:

- If `t == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.
- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

For the T4 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.
- If `wback && n == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction operates without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.

  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

Non-Confidential - Beta

- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

## STR (register)

For a description of this instruction and the encoding, see *STR (register)* on page F6-3055.

### *CONSTRAINED UNPREDICTABLE behavior*

For the T2 encoding:

- If `t == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.
- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

For the A1encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.
- If `wback && n == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction operates without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.

  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

    **Note**

    Pre-indexed addressing and post-indexed addressing imply writeback.

- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

### STRB (immediate, A32)

For a description of this instruction and the encoding, see *STRB (immediate)* on page F6-3058.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `t == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.
- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.
- If `wback && n == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction operates without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.

  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

    **Note**

    Pre-indexed addressing and post-indexed addressing imply writeback.
- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

### STRB (immediate), T32

For a description of this instruction and the encoding, see *STRB (immediate)* on page F6-3058.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the T3 encoding:

- If `t == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.
- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

Non-Confidential - Beta

- If `wback && n == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction operates without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.

  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

## STRB (register)

For a description of this instruction and the encoding, see *STRB (register)* on page F6-3061.

### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 and T2 encoding:

- If `t == 15` is UNPREDICTABLE, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

For the A1 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.
- If `wback && n == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction operates without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.

  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

Non-Confidential - Beta

## STRBT

For a description of this instruction and the encoding, see *STRBT* on page F6-3063.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `t == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.
- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

For the A1 and A2 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.
- If `wback && n == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction operates without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.
  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

## STRD (immediate)

For a description of this instruction and the encoding, see *STRD (immediate)* on page F6-3065.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `t == 15` or `t2 == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

- If `wback && (n == t || n == t2)`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store of the registers specified using the specified addressing mode but the value of the registers stored is UNKNOWN.
- If `wback && n == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction operates without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.

  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

  **Note**

  Pre-indexed addressing and post-indexed addressing imply writeback.

- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

For the A1 encoding:

- If `Rt<0>=='1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The behavior is the same as if `Rt<0>=='0'`.
  - The registers accessed are both specified by Rt. For example, Rt and Rt+1 are the same, and both have bit[0] equal to 1.
  - The registers accessed are specified by Rt and Rt+1.

    **Note**

    This does not apply if `Rt=='1111'`.

- If `P == '0' && W == '1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction is treated as a `NOP`.
  - The instruction behaves as if the values of P and W were one of:

    ```
    P == '1' && W == '0'
    P == '1' && W == '1'
    P == '0' && W == '0'
    ```

*Non-Confidential - Beta*

### STRD (register)

For a description of this instruction and the encoding, see *STRD (register)* on page F6-3067.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `t2 == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.
- If `wback && (n == t || n == t2)`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store of the registers specified using the specified addressing mode but the value of the registers stored is UNKNOWN.
- If `wback && n == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction operates without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.

  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

  **Note**

  Pre-indexed addressing and post-indexed addressing imply writeback.

- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.
- If `Rt<0>=='1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The behavior is the same as if `Rt<0>=='0'`.
  - The registers accessed are both specified by Rt. For example, Rt and Rt+1 are the same, and both have bit[0] equal to 1.
  - The registers accessed are specified by Rt and Rt+1.

    **Note**

    This does not apply if `Rt=='1111'`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- If `P == '0' && W == '1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction is treated as a `NOP`.
  - The instruction behaves as if the values of P and W were one of:
    `P == '1' && W == '0'`
    `P == '1' && W == '1'`
    `P == '0' && W == '0'`

## STREX

For a description of this instruction and the encoding, see *STREX* on page F6-3069.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction executes, but the value stored is UNKNOWN.
- If `d == n`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store to an UNKNOWN address.
- If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.
- If the instruction specifies that `t2==15`, then the requirements described in *Using R15* on page K1-5423 apply.

## STREXB

For a description of this instruction and the encoding, see *STREXB* on page F6-3071.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction executes, but the value stored is UNKNOWN.
- If `d == n`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store to an UNKNOWN address.
- If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.
- If the instruction specifies that `t2==15`, then the requirements described in *Using R15* on page K1-5423 apply.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## STREXD

For a description of this instruction and the encoding, see *STREXD* on page F6-3073.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction executes, but the value stored is UNKNOWN.
- If `d == n`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store to an UNKNOWN address.
- If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.
- If the instruction specifies that `t2==15`, then the requirements described in *Using R15* on page K1-5423 apply.

For the A1 encoding:

- If `Rt<0>=='1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The behavior is the same as if `Rt<0>=='0'`.
  - The register accessed are both specified by Rt. For example, Rt and Rt+1 are the same, and both have bit[0] == 1.
  - The registers accessed are specified by Rt and R+1.

## STREXH

For a description of this instruction and the encoding, see *STREXH* on page F6-3075.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction executes, but the value stored is UNKNOWN.
- If `d == n`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store to an UNKNOWN address.
- If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.
- If the instruction specifies that `t2==15`, then the requirements described in *Using R15* on page K1-5423 apply.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### STRH (immediate, A32)

For a description of this instruction and the encoding, see *STRH (immediate)* on page F6-3077.

#### *CONSTRAINED UNPREDICTABLE behavior*

For the A1 encoding:

- If `t == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.
- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.
- If `wback && n == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction operates without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.

  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

    **Note**

    Pre-indexed addressing and post-indexed addressing imply writeback.

- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

### STRH (immediate, T32)

For a description of this instruction and the encoding, see *STRH (immediate)* on page F6-3077.

#### *CONSTRAINED UNPREDICTABLE behavior*

For T2 and T3 encodings:

- If `t == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.
- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For the T3 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.
- If `wback && n == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction operates without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.

  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

## STRH (register)

For a description of this instruction and the encoding, see *STRH (register)* on page F6-3080.

### *CONSTRAINED UNPREDICTABLE behavior*

For the T2 and A1 encoding:

- If `t == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.
- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

For the A1 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- If `wback && n == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction operates without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.

  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

    **Note**

    Pre-indexed addressing and post-indexed addressing imply writeback.

### STRHT

For a description of this instruction and the encoding, see *STRHT* on page F6-3082.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `t == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.
- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

For the A1 and A2 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.
- If `wback && n == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction operates without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.

  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

    **Note**

    Pre-indexed addressing and post-indexed addressing imply writeback.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## STRT

For a description of this instruction and the encoding, see *STRT* on page F6-3084.

### *CONSTRAINED UNPREDICTABLE behavior*

For the T1 encoding:

- If `t == 15` is UNPREDICTABLE, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

For the A1 and A2 encoding:

- If `wback && n == t`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.
- If `wback && n == 15`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The store instruction operates without writeback.

    **Note**

    This is consistent with ignoring writes to the PC.

  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page K1-5423 apply.

    **Note**

    Pre-indexed addressing and post-indexed addressing imply writeback.

- The value used by stores using R15 as a base register follow the requirements described in *Using R15* on page K1-5423.

## UBFX

For a description of this instruction and the encoding, see *UBFX* on page F6-3134.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `msbit > 31`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The output value in the register is UNKNOWN.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## UDIV

For a description of this instruction and the encoding, see *UDIV* on page F6-3138.

### *CONSTRAINED UNPREDICTABLE behavior*

For the T1encoding:

- If hw2 bits[15:12] !='1111', then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs a divide with no side-effects on other registers.
  - The instruction performs a divide and the register specified by bits[15:12] becomes UNKNOWN.

  **Note**

  This is an exception to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426.

For the A1 encoding:

- If bits[15:12] !='1111', then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs a divide with no side-effects on other registers.
  - The instruction performs a divide and the register specified by bits[15:12] becomes UNKNOWN.

  **Note**

  This is an exception to the requirements described in *SBZ or SBO fields in instructions* on page K1-5426.

## UMAAL

For a description of this instruction and the encoding, see *UMAAL* on page F6-3152.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If dHi == dLo, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register takes an UNKNOWN value.

## UMLAL

For a description of this instruction and the encoding, see *UMLAL, UMLALS* on page F6-3154.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If dHi == dLo, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register takes an UNKNOWN value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### UMULL

For a description of this instruction and the encoding, see *UMULL, UMULLS* on page F6-3156.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `dHi == dLo`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The destination register takes an UNKNOWN value.

## K1.1.27 CONSTRAINED UNPREDICTABLE behavior for A32 and T32 system instructions in the base instruction set

This section lists the CONSTRAINED UNPREDICTABLE behavior for the different A32 and T32 system instructions.

**Note**

If an instruction can result in CONSTRAINED UNPREDICTABLE behavior that is not specific to that particular instruction, see the relevant section in this appendix for a description of the CONSTRAINED UNPREDICTABLE behavior.

### CPS (A32)

For a description of this instruction and the encoding, see *CPS, CPSID, CPSIE* on page F6-2662.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If the instruction transfers an illegal mode encoding to PSTATE.M, then this invokes an illegal exception return by not changing the mode, and setting PSTATE.IL to 1.

  **Note**

  - An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.
  - `CPS` executed from User mode acts as a `NOP`.

For the A1 encoding:

- If `(imod == '00 && M =='0') || imod == '01'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
- If `mode != '00000' && M == '0'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as if `M == '1'`.
  - The instruction operates as if `mode == '0000'`.
- If `(imod<1> == '1' && A:I:F == '000')`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction behaves as if `imod<1> == '0'`.
  - The instruction behaves as if `A:I:F` had an UNKNOWN nonzero value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- If (imod<1> == '0' && A:I:F != 000) then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction behaves as if imod<1> == '1'.
  - The instruction behaves as if A:I:F == 000.

## CPS (T32)

For a description of this instruction and the encoding, see *CPS, CPSID, CPSIE* on page F6-2662.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If the instruction transfers an illegal mode encoding to PSTATE.M, then this invokes the illegal exception return by not changing the mode, and setting PSTATE.IL to 1.

  **Note**

  - An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.
  - CPS executed from User mode acts as a NOP.

For the T1 encoding:

- If A:I:F == '000', then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.

For the T2 encoding:

- If imod == '01', then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
- If mode != '00000' && M == '0', then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as if M =='1'.
  - The instruction behaves as if mode == '0000'.
- If (imod<1> == '1' && A:I:F == '000'), then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction behaves as if imod<1> == '0'.
  - The instruction behaves as if A:I:F had an UNKNOWN nonzero value.
- If (imod<1> == '0' && A:I:F != '000') then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction behaves as if imod<1> == '1'.
  - The instruction behaves as if A:I:F == '000'.

Non-Confidential - Beta

## LDM (exception return)

For a description of this instruction and the encoding, see *LDM (exception return)* on page F6-2714.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If this instruction is executed in User mode or in System mode, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
- If `wback && registers<n> == '1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction performs all the loads using the specified addressing mode and the content of the register being written back is UNKNOWN. In addition, if an exception occurs during the execution of this instruction, the base address might be corrupted so that the instruction cannot be repeated.
- If the instruction transfers an illegal mode encoding PSTATE.M, then this invokes the illegal exception return.

  **Note**

  An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.

## LDM (User registers)

For a description of this instruction and the encoding, see *LDM (User registers)* on page F6-2716.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `BitCount(registers) < 1`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as an `LDM` with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.
- If this instruction is executed in User mode or in System mode, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as an `LDM` with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## MRS

For a description of this instruction and the encoding, see *MRS* on page F6-2830.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If this instruction is executed in User mode or in System mode and is accessing the SPSR, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.

## MSR (immediate)

For a description of this instruction and the encoding, see *MSR (immediate)* on page F6-2838.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If the instruction is executed in User mode or in System mode and is accessing the SPSR, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
- If `mask == '0000' && R == '1'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.

  If the instruction transfers an illegal mode encoding to PSTATE.M, then this invokes the illegal exception return by not changing the mode, and setting PSTATE.IL to 1.

  **Note**

  An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.

## MSR (register)

For a description of this instruction and the encoding, see *MSR (register)* on page F6-2840.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If this instruction is executed in User mode or in System mode and is accessing the SPSR, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- If `mask == '0000'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.

  If the instruction transfers an illegal mode encoding to PSTATE.M, then this invokes the illegal exception return by not changing the mode, and setting PSTATE.IL to 1.

  **Note**

  An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.

### RFE

For a description of this instruction and the encoding, see *RFE, RFEDA, RFEDB, RFEIA, RFEIB* on page F6-2915.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If this instruction is executed in User mode, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
- If the instruction transfers an illegal mode encoding to PSTATE.M, then this invokes the illegal exception return.

  **Note**

  An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.

### SRS (T32)

For a description of this instruction and the encoding, see *SRS, SRSDA, SRSDB, SRSIA, SRSIB* on page F6-3013.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If this instruction is executed in User mode or in System mode, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
- If the instruction specifies an illegal mode field, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - R13 of the current mode is used.
  - The store occurs to an UNKNOWN address, and if the instruction specifies writeback, any general-purpose register that can be accessed without privilege violation from the current Exception level become UNKNOWN.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## SRS (A32)

For a description of this instruction and the encoding, see *SRS, SRSDA, SRSDB, SRSIA, SRSIB* on page F6-3013.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If this instruction is executed in User mode or in System mode, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
- If the instruction specifies an illegal mode field, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - R13 of the current mode is used.
  - The store occurs to an UNKNOWN address, and if the instruction specifies writeback, any general-purpose register that can be accessed without privilege violation from the current Exception level become UNKNOWN.

## STM (User registers)

For a description of this instruction and the encoding, see *STM (User registers)* on page F6-3043.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `BitCount(registers) < 1`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as an `STM` with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.
- If the instruction is executed from User mode or System mode, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as an `STM` with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### SUBS PC, LR and related instructions (T32)

For a description of this instruction and the encoding, see the exception return form of *SUB, SUBS (immediate)* on page F6-3088.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If this instruction is executed in User mode or in System mode, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
- If the instruction transfers an illegal mode encoding to PSTATE.M, then this invokes the illegal exception return.

  **Note**

  An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.

For this encoding:

- If hw2[3:0] are `0b1110`, and the instruction is executed when not in Hyp mode, System mode, or User mode, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction is treated as a `NOP`.
  - The instruction is treated as if hw2[3:0] are `0b1110`.
  - The program counter is set using the value in the register specified by hw2[3:0].

### SUBS PC. LR and related instructions (A32)

For a description of this instruction and the encoding, see the exception return forms of *MOV, MOVS (register)* on page F6-2813 and *SUB, SUBS (immediate)* on page F6-3088.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If this instruction is executed in User mode or in System mode, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
- If the instruction transfers an illegal mode encoding to PSTATE.M, then this invokes the illegal exception return.

  **Note**

  An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.

## K1.1.28 CONSTRAINED UNPREDICTABLE behavior, A32 and T32 Advanced SIMD and floating-point instructions

This section lists the CONSTRAINED UNPREDICTABLE behavior for the different A32 and T32 Advanced SIMD and floating-point instructions listed in *Alphabetical list of floating-point and Advanced SIMD instructions* on page F7-3208.

**Note**

- The pseudocode used in this section to describe cases that can result in CONSTRAINED UNPREDICTABLE behavior does not necessarily match the encoding specific pseudocode for a specific instruction.
- If an instruction can result in CONSTRAINED UNPREDICTABLE behavior that is not specific to that particular instruction, see the relevant section in this appendix for a description of the CONSTRAINED UNPREDICTABLE behavior.

### VCVT (between floating-point and fixed-point)

For a description of this instruction and the encoding, see *VCVT (between floating-point and fixed-point, floating-point)* on page F7-3340.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `frac_bits < 0`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The result of the conversion is UNKNOWN.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

### VLD1 (multiple single elements)

For a description of this instruction and the encoding, see *VLD1 (multiple single elements)* on page F7-3400.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d+regs > 32`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### VLD1 (single element to all lanes)

For a description of this instruction and the encoding, see *VLD1 (single element to all lanes)* on page F7-3397.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d+regs > 32`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

### VLD2 (multiple 2-element structures)

For a description of this instruction and the encoding, see *VLD2 (multiple 2-element structures)* on page F7-3409.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d2+regs > 32`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

### VLD2 (single 2-element structure to one lane)

For a description of this instruction and the encoding, see *VLD2 (single 2-element structure to one lane)* on page F7-3403.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d2 > 31`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### VLD2 (single 2-element structure to all lanes)

For a description of this instruction and the encoding, see *VLD2 (single 2-element structure to all lanes)* on page F7-3406.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d2 > 31`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

### VLD3 (multiple 3-element structures)

For a description of this instruction and the encoding, see *VLD3 (multiple 3-element structures)* on page F7-3418.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d3 > 31`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

### VLD3 (single 3-element structure to one lane)

For a description of this instruction and the encoding, see *VLD3 (single 3-element structure to one lane)* on page F7-3412.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d3 > 31`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### VLD3 (single 3-element structure to all lanes)

For a description of this instruction and the encoding, see *VLD3 (single 3-element structure to all lanes)* on page F7-3415.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d+regs > 32`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

### VLD4 (multiple 4-element structures)

For a description of this instruction and the encoding, see *VLD4 (multiple 4-element structures)* on page F7-3427.

#### *CONSTRAINED UNPREDICTABLE behavior*

If `d3 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

### VLD4 (single 4-element structure to one lane)

For a description of this instruction and the encoding, see *VLD4 (single 4-element structure to one lane)* on page F7-3421.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d4 > 31`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## VLD4 (single 4-element structure to all lanes)

For a description of this instruction and the encoding, see *VLD4 (single 4-element structure to all lanes)* on page F7-3424.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d4 > 31`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

## VLDM

For a description of this instruction and the encoding, see *VLDM, VLDMDB, VLDMIA* on page F7-3430.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `regs == 0`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as a `VLDM` or a `VPOP` with the same addressing mode but loads no registers.
- If the register list includes a register that is out of range, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - One or more of the SIMD&FP registers become UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

**Note**

Out of range means that the register list includes:

- A register with a number greater than the number of registers implemented.
- More than 16 double word registers.
- A double word register specified as D16-D31 with an odd value of `imm8`.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### VMOV (between two general-purpose registers and two single-precision registers)

For a description of this instruction and the encoding, see *VMOV (between two general-purpose registers and two single-precision registers)* on page F7-3489.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `to_arm_registers && t == t2`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The destination register becomes UNKNOWN.

  If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.
- If `m == 31`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - One or more of the SIMD&FP single-precision registers become UNKNOWN for a move to the single-precision register. The general-purpose registers listed in the instruction become UNKNOWN for a move from the single-precision registers. This behavior does not affect any other general-purpose registers.

### VMOV (between two general-purpose registers and a doubleword floating-point register)

For a description of this instruction and the encoding, see *VMOV (between two general-purpose registers and a doubleword floating-point register)* on page F7-3474.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `to_arm_registers && t == t2`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The destination register becomes UNKNOWN.

  If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## VMRS

For a description of this instruction and the encoding, see *VMRS* on page F7-3495.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `t == 15 && reg !='0001'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction transfers an UNKNOWN value to the specified general-purpose register.

In addition, `CheckVFPEnabled(FALSE)` can be called by this instruction for the CONSTRAINED UNPREDICTABLE cases.

## VMSR

For a description of this instruction and the encoding, see *VMSR* on page F7-3497.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `reg!= '000x' && reg!='1000'`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction transfers the value in the general-purpose register to one of the allocated registers accessible using `VMSR` at the same Exception level.

In addition, `CheckVFPEnabled(FALSE)` can be called by this instruction for the CONSTRAINED UNPREDICTABLE cases.

## VPOP

For a description of this instruction and the encoding, see *VPOP* on page F7-3549.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `regs == 0`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as a `VLDM` or a `VPOP` with the same addressing mode but loads no registers.
- If the register list includes a register that is out of range, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - One or more of the SIMD&FP registers become UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

**Note**

Out of range means that the register list includes:

- A register with a number greater than the number of registers implemented.
- More than 16 double word registers.
- A double word register specified as D16-D31 with an odd value of `imm8`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

## VPUSH

For a description of this instruction and the encoding, see *VPUSH* on page F7-3551.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `regs == 0`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as a `VSTM` or `VPUSH` with the same addressing mode but loads no registers.
- If the register list includes a register that is out of range, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

**Note**

Out of range means that the register list includes:

- A register with a number greater than the number of registers implemented.
- More than 16 double word registers.
- A double word register specified as D16-D31 with an odd value of `imm8`.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

## VST1 (multiple single elements)

For a description of this instruction and the encoding, see *VST1 (multiple single elements)* on page F7-3690.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d+regs > 32`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## VST2 (multiple 2-element structures)

For a description of this instruction and the encoding, see *VST2 (multiple 2-element structures)* on page F7-3696.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d2+regs > 32`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

## VST2 (single 2-element structure from one lane)

For a description of this instruction and the encoding, see *VST2 (single 2-element structure from one lane)* on page F7-3693.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d2 > 31`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## VST3 (multiple 3-element structures)

For a description of this instruction and the encoding, see *VST3 (multiple 3-element structures)* on page F7-3702.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d3 > 31`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

## VST3 (single 3-element structure from one lane)

For a description of this instruction and the encoding, see *VST3 (single 3-element structure from one lane)* on page F7-3699.

### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d3 > 31`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### VST4 (multiple 4-element structures)

For a description of this instruction and the encoding, see *VST4 (multiple 4-element structures)* on page F7-3708.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d4 > 31`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

### VST4 (single 4-element structure from one lane)

For a description of this instruction and the encoding, see *VST4 (single 4-element structure from one lane)* on page F7-3705.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `d4 > 31`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

### VSTM

For a description of this instruction and the encoding, see *VSTM, VSTMDB, VSTMIA* on page F7-3711.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If `regs == 0`, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a `NOP`.
  - The instruction operates as a `VSTM` or `VPUSH` with the same addressing mode but loads no registers.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- If the register list includes a register that is out of range, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

**Note**

Out of range means that the register list includes:

- A register with a number greater than the number of registers implemented.
- More than 16 double word registers.
- A double word register specified as D16-D31 with an odd value of imm8.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

### VTBL, VTBX

For a description of this instruction and the encoding, see *VTBL, VTBX* on page F7-3729.

#### *CONSTRAINED UNPREDICTABLE behavior*

For all encodings:

- If n + length > 32, then one of the following behaviors must occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD&FP registers become UNKNOWN. This behavior does not affect any general-purpose registers.

## K1.1.29 CONSTRAINED UNPREDICTABLE behaviors associated with the VTCR

The following subsections describe the CONSTRAINED UNPREDICTABLE behavior associated with programming the VTCR:

- *VTCR.S*.
- *CONSTRAINED UNPREDICTABLE combinations of the starting level and size fields*.

### VTCR.S

VTCR.S must be programmed to T0SZ[3], or the effect is CONSTRAINED UNPREDICTABLE. For the ARMv8-A architecture, if VTCR.S is not programmed correctly, then the stage 2 T0SZ value is treated as an UNKNOWN value.

### CONSTRAINED UNPREDICTABLE combinations of the starting level and size fields

If the stage 2 input address size, as programmed in VTCR.T0SZ, is out of range with respect to the starting level, as programmed in the VTCR.SL0 field at the time of a translation walk that uses the stage 2 translation, then a stage 2 level 1 Translation Fault is generated.

## K1.1.30 CONSTRAINED UNPREDICTABLE behavior in Debug state

*Behavior in Debug state* on page H2-4832 of this manual describes the CONSTRAINED UNPREDICTABLE behaviors that are specifically associated with Debug state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## K1.1.31 CONSTRAINED UNPREDICTABLE behavior of EL2 features

The following sections describe CONSTRAINED UNPREDICTABLE behavior that can occur in an implementation that includes EL2 where EL2 can use AArch32:

- *ERET in User mode or System mode*.
- *Accessing Hyp mode from outside Hyp mode*.
- *Modifying PSTATE.M when in Hyp mode*
- *Use of Hyp mode in Secure state*.
- *Instructions which are UNDEFINED or CONSTRAINED UNPREDICTABLE in Hyp mode* on page K1-5498.
- *Exception return to Hyp mode* on page K1-5498.
- *Accessing registers that cannot be accessed using MSR/MRS instructions* on page K1-5498.
- *Memory type handling* on page K1-5498.
- *Hyp mode TLB maintenance instructions* on page K1-5499.
- *Hyp mode VA to PA address translation instructions* on page K1-5499.
- *Stage 1 default memory type* on page K1-5499.
- *Trapping of general exceptions to Hyp mode* on page K1-5499.
- *Prevention of rootskits using Hyp mode or Secure state* on page K1-5500.
- *HVC* on page K1-5500.
- *MSR/MRS banked registers* on page K1-5500.

### ERET in User mode or System mode

If ERET is executed in User mode or System mode, it behaves as described in *SUBS PC, LR and related instructions (T32)* on page K1-5484.

### Accessing Hyp mode from outside Hyp mode

Attempting to change into Hyp mode or out of Hyp mode using the `MSR` or `CPS` instruction invokes the ARMv8 illegal exception return by not changing the mode, and setting PSTATE.IL to 1.

`SRS` using the Hyp mode SP from Non-secure modes other than Hyp mode, or from Secure state, is handled as described in *SRS (T32)* on page K1-5482 and *SRS (A32)* on page K1-5483.

### Modifying PSTATE.M when in Hyp mode

Attempting to change into Hyp mode or out of Hyp mode using the `MSR` or `CPS` instruction invokes the ARMv8 illegal exception return by not changing the mode, and setting PSTATE.IL to 1.

`SRS` using the Hyp mode SP from Non-secure modes other than Hyp mode, or from Secure state, is handled as described in *SRS (T32)* on page K1-5482 and *SRS (A32)* on page K1-5483.

### Use of Hyp mode in Secure state

Attempting to change into Hyp mode or out of Hyp mode using the `MSR` or `CPS` instruction invokes the ARMv8 illegal exception return by not changing the mode, and setting PSTATE.IL to 1.

`SRS` using the Hyp mode SP from Non-secure modes other than Hyp mode, or from Secure state, is handled as described in *SRS (T32)* on page K1-5482 and *SRS (A32)* on page K1-5483.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Instructions which are UNDEFINED or CONSTRAINED UNPREDICTABLE in Hyp mode

If LDRT, LDRSHT, LDRHT, LDRSBT, LDRBT, STRT, STRHT or STRBT are executed in Hyp mode, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the equivalent, corresponding LDR, LDRSH, LDRH, LDRSB, LDRB, STR, STRH or STRB instruction in Hyp mode.

### Exception return to Hyp mode

Exception returns to Hyp mode when SCR.NS == 0 or from a Non-secure PL1 mode invokes the ARMv8 illegal exception return.

### Accessing registers that cannot be accessed using MSR/MRS instructions

The following MSR and MRS instructions can lead to CONSTRAINED UNPREDICTABLE behavior:

```
MSR <Rm>_<mode>, <Rn>

MSR SPSR_<mode>, <Rn>

MSR ELR_hyp, <Rn>

MRS <Rn>, <Rm>_<mode>

MRS <Rn>, SPSR_<mode>

MRS <Rn>, ELR_hyp
```

If these instructions are executed in either Secure or Non-secure User mode, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

If the MSR and MRS instructions attempt to access a register that cannot be legally accessed, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- For MRS instructions, the destination general-purpose register becomes UNKNOWN.
- For MSR instructions, if the register specified could be accessed from the current mode by other mechanisms, then this register is UNKNOWN. Otherwise the instruction executes as a NOP.

### Memory type handling

If the attributes for a memory location after combining stage 1 and stage 2 of a translation regime is Normal Inner Non-cacheable, Outer Non-cacheable, then the shareability attributes after combining the two stages of translation is Outer Shareable.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### Hyp mode TLB maintenance instructions

If a TLBIMVAH, TLBIMVALH, TLBIMVAHIS, TLBIMVALHIS, TLBIALLNSNH, TLBIALLNSNHIS, TLBIALLH, or a TLBIALLHIS instruction is executed in a Secure Privileged mode other than Monitor mode, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction is executed as if it had been executed in Monitor mode.

For more information about these instructions see *The scope of TLB maintenance instructions* on page G4-4069.

### Hyp mode VA to PA address translation instructions

If an ATS1HR or ATS1HW instruction is executed in a Secure Privileged mode other than Monitor mode, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction is executed as if it had been executed in Monitor mode.

For more information about these instructions see *Address translation instruction naming and operation summary* on page G4-4110.

### Stage 1 default memory type

If HCR.DC == 1, then the behavior of the PE when executing in a Non-secure mode other than Hyp mode is consistent with:

- SCTLR.M == 0, regardless of the actual value of SCTLR.M, other than for the value returned by an explicit read of SCTLR.M.
- HCR.VM == 1, regardless of the actual value of HCR.VM, other than for an explicit read of this bit.

### Trapping of general exceptions to Hyp mode

Attempting to perform an exception return to a Non-secure PL1 mode when HCR.TGE == 1 invokes an illegal exception return.

Attempting to change from Monitor mode to a Non-secure PL1 mode when HCR.TGE == 1 by executing a CPS or MSR instruction generates an Illegal Execution state exception, by not changing the mode, and setting PSTATE.IL to 1.

When EL3 is using AArch32, attempting to change from a Secure PL1 mode to a Non-secure PL1 mode when HCR.TGE is set, by changing SCR.NS from 0 to 1, results in no change of SCR.NS

Because taking an exception into Non-secure PL1 modes leads to a CONSTRAINED UNPREDICTABLE situation, the following additional properties apply when HCR.TGE == 1:

- All exceptions that would be routed to EL1 are routed to EL2.
- Non-secure SCTLR.M is treated as being 0, regardless of its actual value, other than for an explicit read of of this bit.
- HCR.FMO, HCR.IMO, and HCR.AMO are treated as being 1, regardless of their actual value, other than for an explicit read of these bits.
- All virtual interrupts are disabled.
- Any IMPLEMENTATION DEFINED mechanisms for signalling virtual interrupts are disabled.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Prevention of rootskits using Hyp mode or Secure state

If an HVC instruction is executed in Hyp mode when SCR.HCE == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.

If an SMC instruction is executed in a Secure privileged mode when SCR.SCD == 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.

### HVC

For a description of this instruction and the encoding, see *HVC* on page F6-2686.

For the A1 encoding, if `cond field !=1110`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction executes unconditionally.
- The instruction executes conditionally.

### MSR/MRS banked registers

Some unallocated encodings for the `MSR/MRS` banked register instructions can cause CONSTRAINED UNPREDICTABLE behavior. If an unallocated encoding for the `MSR/MRS` banked register instructions is executed, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- An allocated MSR/MRS banked register instruction is executed.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*

## K1.2 Constraints on AArch64 state UNPREDICTABLE behaviors

It contains the following sections:

- *Overview of the constraints on AArch64 UNPREDICTABLE behaviors*.
- *Reserved values in System and memory-mapped registers and translation table entries*.
- *CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values* on page K1-5502.
- *CONSTRAINED UNPREDICTABLE behavior due to inadequate context synchronization* on page K1-5502.
- *Translation table base address alignment* on page K1-5502.
- *The Performance Monitors Extension* on page K1-5502.
- *Syndrome register handling for CONSTRAINED UNPREDICTABLE instructions treated as UNDEFINED* on page K1-5503.
- *Out of range virtual address* on page K1-5503.
- *Instruction fetches from Device memory* on page K1-5504.
- *Programming the CSSELR_EL1.Level for a cache level that is not implemented* on page K1-5504.
- *Crossing a page boundary with different memory types or Shareability attributes* on page K1-5504.
- *Crossing a peripheral boundary with a Device access* on page K1-5505.
- *CONSTRAINED UNPREDICTABLE behavior in Debug state* on page K1-5505.
- *CONSTRAINED UNPREDICTABLE behavior for A64 instructions* on page K1-5505.
- *Out of range values of the Set/Way/Index fields in cache maintenance instructions* on page K1-5513.

### K1.2.1 Overview of the constraints on AArch64 UNPREDICTABLE behaviors

The term UNPREDICTABLE describes a number of cases where the architecture has a feature that software must not use. For execution in AArch64 state, the ARMv8-A architecture specifies a narrow range of permitted behaviors. This range is the range of CONSTRAINED UNPREDICTABLE behavior. All implementations that are compliant with the architecture must follow the CONSTRAINED UNPREDICTABLE behavior.

**Note**

Software designed to be compatible with the ARMv8-A architecture must not rely on these CONSTRAINED UNPREDICTABLE cases being handled in any way other than those listed under the heading CONSTRAINED UNPREDICTABLE.

### K1.2.2 Reserved values in System and memory-mapped registers and translation table entries

Unless otherwise stated in this manual, all unallocated or reserved values of fields with allocated values within AArch64 System registers, memory-mapped registers, and translation table entries behave in one of the following ways:

- The unallocated value maps onto any of the allocated values, but otherwise does not cause CONSTRAINED UNPREDICTABLE behavior.
- The unallocated value causes effects that could be achieved by a combination of more than one of the allocated values.
- The unallocated value causes the field to have no functional effect.

**Note**

These constraints are identical to those for the equivalent AArch32 definitions, as given in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5427.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### K1.2.3 CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values

The ARM architecture allows copies of control values or data values to be cached in a cache or TLB. This can lead to UNPREDICTABLE behavior if the cache or TLB has not been correctly invalidated following a change of the control or data values.

Unless explicitly stated otherwise, the behavior of the PE is consistent with:

- The old data or control value.
- The new data or control value.
- An amalgamation of the control or data values.

**Note**

This rules applies where inadequate invalidation of the TLB might cause multiple hits within the TLB. In this situation, a failure to invalidate the TLB by code running at a given Privilege level must not make access to regions of memory with permissions or attributes that could not be accessed at that Privilege level possible.

Alternatively, an implementation might generate a Data Abort exception when detecting multiple hits within a TLB, using the TLB Conflict fault code.

The choice between these behaviors might, in some implementations, vary for each use of a control or data value.

### K1.2.4 CONSTRAINED UNPREDICTABLE behavior due to inadequate context synchronization

The ARM architecture requires that changes to System registers must be synchronized before they take effect. This can lead to UNPREDICTABLE behavior if the synchronization has not been performed.

In these cases, the behavior of the processor is consistent with the unsynchronized control value being either the old value or the new value.

Where multiple control values are updated but not yet synchronized, each control value might independently be the old value or the new value.

In addition, where the unsynchronized control value applies to different areas of functionality, or what an implementation has constructed as different areas of functionality, those areas might independently treat the control value as being either the old value or the new value.

The choice between these behaviors might, in some implementations, vary for each use of a control value.

### K1.2.5 Translation table base address alignment

Field [x-1:0] in TTBR0_EL1, TTBR1_EL1, TTBR0_EL2, VTTBR_EL2, or TTBR0_EL3 is RES0. If this field does not have a value of 0, this might result in a misaligned translation table base address. In this case, one of the following behaviors must occur:

- The field that is defined to be RES0 is treated as if all the bits had a value of 0:
  - The value read back might be the value written or it might be 0.
- The calculation of an address for a translation table walk using those registers might be corrupted in those bits that are nonzero.

### K1.2.6 The Performance Monitors Extension

The following cases can cause CONSTRAINED UNPREDICTABLE behavior:

- If PMSELR_EL0.SEL is not equal to 31, and PMSELR_EL0.SEL is greater than or equal to PMCR_EL0.N, and the PE is executing in an Exception level in Secure state or in EL2.
- If PMSELR_EL0.SEL is not 31, and PMSELR_EL0.SEL is greater than or equal to MDCR_EL2.HPMN, and the PE is executing in an Exception level in Non-secure state other than in EL2.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

In these cases, one of the following behaviors must occur:

- Any access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 from that state is UNDEFINED.
- Any access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 from that state executes as a NOP.
- Any access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 from that state either:
  - Ignores writes and returns 0 on reads.
  - Behaves as if PMSELR_EL0.SEL contains an UNKNOWN value that is less than PMCR_EL0.N and the PE is executing in an Exception level in Secure state or in EL2, or behaves as if PMSELR_EL0.SEL contains an UNKNOWN value that is less than MDCR_EL2.HPMN if the PE executing in an Exception level in Non-secure state other than in EL2.

If PMSELR_EL0.SEL is equal to 31, then one of the following behaviors must occur:

- Any access to PMXEVCNTR_EL0 is UNDEFINED.
- Any access to PMXEVCNTR_EL0 executes as a NOP.
- Any access to PMXEVCNTR_EL0 either:
  - Ignores writes and returns 0 on reads.
  - Behaves as if PMSELR_EL0.SEL contains an UNKNOWN value that is less than PMCR_EL0.N and the PE is executing in an Exception level in Secure state or in EL2, or behaves as if PMSELR_EL0.SEL contains an UNKNOWN value that is less than MDCR_EL2.HPMN if the PE is executing in an Exception level in Non-secure state other than in EL2.

If MDCR_EL2.HPMN is set to 0, or to a value larger than PMCR_EL0.N, then the following CONSTRAINED UNPREDICTABLE behavior applies:

- The value returned by a direct read of MDCR_EL2.HPMN is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 use. That is, the PE behaves as if MDCR_EL2.HPMN is set to an UNKNOWN non-zero value less than PMCR_EL0.N.
  - All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

### K1.2.7 Syndrome register handling for CONSTRAINED UNPREDICTABLE instructions treated as UNDEFINED

When a CONSTRAINED UNPREDICTABLE instruction is treated as UNDEFINED, ESR_ELx is UNKNOWN.

**Note**

The value written to ESR_ELx must be consistent with a value that could be created as the result of an exception from the same Exception level that generated the exception, but was the result of a situation that is not CONSTRAINED UNPREDICTABLE at that Exception level. This is to avoid a possible privilege violation.

### K1.2.8 Out of range virtual address

Because of program counter alignment constraints, it is impossible for a PE to fetch an A64 instruction that includes the bytes at virtual address `0xFFFF FFFF FFFF FFFF` and `0x0000 0000 0000 0000`.

If the PE executes a load or store instruction with tagged addressing disabled in the current translation regime, and where the computed virtual address, total access size, and alignment mean that it accesses the bytes at `0xFFFF FFFF FFFF FFFF` and `0x0000 0000 0000 0000`, then the bytes that appear to be from `0x0000 0000 0000 0000` onwards are accessed at an UNKNOWN address.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If the PE executes a load or store instruction with tagged addressing enabled in the current translation regime, and where the computed address, total access size, and alignment mean that it accesses the bytes at `0xFFFF FFFF FFFF FFFF` and `0x0000 0000 0000 0000`, then the bytes that appear to be from `0x0000 0000 0000 0000` onwards are accessed at an UNKNOWN address and the tags associated with address also become UNKNOWN.

### K1.2.9 Instruction fetches from Device memory

Instruction fetches from Device memory are CONSTRAINED UNPREDICTABLE.

If a location in memory has the Device attribute and is not marked as execute-never, then an implementation might perform speculative instruction accesses to this memory location at times when address translation is enabled.

If a branch causes the program counter to point to an area of memory with the Device attribute that is not marked as execute-never for the current Exception level for instruction fetches, then an implementation must perform one of the following behaviors:

- It treats the instruction fetch as if it were to a memory location with the Normal, Non-cacheable attribute.
- It generates a Permission fault.

### K1.2.10 Programming the CSSELR_EL1.Level for a cache level that is not implemented

If the CSSELR_EL1.Level is programmed to a cache level that is not implemented, then a read of CSSELR_EL1 returns an UNKNOWN value in CSSELR_EL1.Level.

If the CSSELR_EL1.Level is programmed to a cache level that is not implemented, then on a read of CCSIDR_EL1 an implementation must perform one of the following behaviors:

- The CCSIDR_EL1 read executes as a `NOP`.
- The CCSIDR_EL1 read is UNDEFINED.
- The CCSIDR_EL1 read returns an UNKNOWN value.

### K1.2.11 Crossing a page boundary with different memory types or Shareability attributes

A memory access from a load or store instruction that crosses a page boundary to a memory location that has a different memory type or Shareability attribute results in CONSTRAINED UNPREDICTABLE behavior. In this case, the implementation must perform one of the following behaviors:

- All memory accesses generated by the instruction use the memory type and Shareability attributes associated with the first address accessed by the instruction.
- All memory accesses generated by the instruction use the memory type and Shareability attributes associated with the last address accessed by the instruction.
- Each memory access generated by the instruction uses the memory type and Shareability attribute associated with its own address.
- The instruction generates an Alignment fault caused by the memory type.

  For the Non-secure EL1&0 translation regime:
  - If the stage 1 translation generated the mismatch then the resulting exception is taken to EL1.
  - If the stage 2 translation generated the mismatch then the resulting exception is taken to EL2.
  - If both stages of translation generate the mismatch then the exception can be taken to either EL1 or EL2.
- The instruction executes as a `NOP`.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### K1.2.12 Crossing a peripheral boundary with a Device access

Performing memory accesses from one load or store instruction to Device memory that crosses a boundary corresponding to the smallest translation granule size of the implementation causes CONSTRAINED UNPREDICTABLE behavior. In this case, the implementation performs one of the following behaviors:

- All memory accesses generated by the instruction are performed as if the boundary has no effect on the memory accesses.
- All memory accesses generated by the instruction are performed as if the boundary has no effect on the memory accesses except that there is no guarantee of ordering between memory accesses.
- The instruction generates an alignment fault caused by the memory type.

  For the Non-secure EL1&0 translation regime:

  — If the stage 1 translation causes the boundary to be crossed then the resulting exception is taken to EL1.

  — If the stage 2 translation causes the boundary to be crossed then the resulting exception is taken to EL2.

  — If both stages of translation cause the boundary to be crossed then the resulting exception can be taken to either EL1 or EL2.
- The instruction executes as a `NOP`.

**Note**

The boundary referred to is between two Device memory regions that are both:
- Of the size of the smallest implemented translation granule.
- Aligned to the size of the smallest implemented translation granule.

### K1.2.13 CONSTRAINED UNPREDICTABLE behavior in Debug state

*Behavior in Debug state* on page H2-4832 of this manual describes the CONSTRAINED UNPREDICTABLE behaviors that are specifically associated with Debug state.

### K1.2.14 CONSTRAINED UNPREDICTABLE behavior for A64 instructions

This section lists the CONSTRAINED UNPREDICTABLE behavior for the different A64 instructions listed in Chapter C6 *A64 Base Instruction Descriptions* and Chapter C7 *A64 Advanced SIMD and Floating-point Instruction Descriptions*.

#### LDAXP

For a description of this instruction and the encoding, see *LDAXP* on page C6-540.

##### *CONSTRAINED UNPREDICTABLE behavior*

If `t == t2`, then one of the following behaviors must occur:
- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## LDNP (SIMD&FP)

For a description of this instruction and the encoding, see *LDNP (SIMD&FP)* on page C7-1128.

### *CONSTRAINED UNPREDICTABLE behavior*

If `t == t2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value.

## LDP

For a description of this instruction and the encoding, see *LDP* on page C6-554.

### *CONSTRAINED UNPREDICTABLE behavior*

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `(t == n || t2 == n) && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

If t == t2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs all of the loads using the specified addressing mode, and the register loaded is set to an UNKNOWN value.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

## LDP (SIMD&FP)

For a description of this instruction and the encoding, see *LDP (SIMD&FP)* on page C7-1130.

### *CONSTRAINED UNPREDICTABLE behavior*

If `t == t2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## LDPSW

For a description of this instruction and the encoding, see *LDPSW* on page C6-558.

### *CONSTRAINED UNPREDICTABLE behavior*

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `(t == n || t2 == n) && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

If `t == t2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs all of the loads using the specified addressing mode, and the register loaded is set to an UNKNOWN value.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

## LDR (immediate)

For a description of this instruction and the encoding, see *LDR (immediate)* on page C6-561.

### *CONSTRAINED UNPREDICTABLE behavior*

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### LDRB (immediate)

For a description of this instruction and the encoding, see *LDRB (immediate)* on page C6-570.

#### *CONSTRAINED UNPREDICTABLE behavior*

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

### LDRH (immediate)

For a description of this instruction and the encoding, see *LDRH (immediate)* on page C6-576.

#### *CONSTRAINED UNPREDICTABLE behavior*

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

### LDRSB (immediate)

For a description of this instruction and the encoding, see *LDRSB (immediate)* on page C6-582.

#### *CONSTRAINED UNPREDICTABLE behavior*

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## LDRSH (immediate)

For a description of this instruction and the encoding, see *LDRSH (immediate)* on page C6-588.

### *CONSTRAINED UNPREDICTABLE behavior*

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

## LDRSW (immediate)

For a description of this instruction and the encoding, see *LDRSW (immediate)* on page C6-594.

### *CONSTRAINED UNPREDICTABLE behavior*

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

## LDXP

For a description of this instruction and the encoding, see *LDXP* on page C6-628.

### *CONSTRAINED UNPREDICTABLE behavior*

If `t == t2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### STP

For a description of this instruction and the encoding, see *STP* on page C6-742.

#### *CONSTRAINED UNPREDICTABLE behavior*

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `(t == n || t2 == n) && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs a store using the specified addressing mode but the value stored is UNKNOWN.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

### STLXP

For a description of this instruction and the encoding, see *STLXP* on page C6-728.

#### *CONSTRAINED UNPREDICTABLE behavior*

If `s == t || (s == t2)`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If `s == n && n != 31` then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to an UNKNOWN address.

### STLXR

For a description of this instruction and the encoding, see *STLXR* on page C6-731.

#### *CONSTRAINED UNPREDICTABLE behavior*

If `s == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If `s == n && n != 31` then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to an UNKNOWN address.

### STLXRB

For a description of this instruction and the encoding, see *STLXRB* on page C6-734.

#### *CONSTRAINED UNPREDICTABLE behavior*

If `s == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If `s == n && n != 31` then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to an UNKNOWN address.

### STLXRH

For a description of this instruction and the encoding, see *STLXRH* on page C6-737.

#### *CONSTRAINED UNPREDICTABLE behavior*

If `s == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If `s == n && n != 31` then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to an UNKNOWN address.

### STR (immediate)

For a description of this instruction and the encoding, see *STR (immediate)* on page C6-746.

#### *CONSTRAINED UNPREDICTABLE behavior*

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs a store using the specified addressing mode but the value stored is UNKNOWN.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

### STRB (immediate)

For a description of this instruction and the encoding, see *STRB (immediate)* on page C6-752.

#### *CONSTRAINED UNPREDICTABLE behavior*

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs a store using the specified addressing mode but the value stored is UNKNOWN.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### STRH (immediate)

For a description of this instruction and the encoding, see *STRH (immediate)* on page C6-758.

#### *CONSTRAINED UNPREDICTABLE behavior*

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and `n == t && n != 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs a store using the specified addressing mode but the value stored is UNKNOWN.

**Note**

Pre-indexed addressing and post-indexed addressing imply writeback.

### STXP

For a description of this instruction and the encoding, see *STXP* on page C6-777.

#### *CONSTRAINED UNPREDICTABLE behavior*

If `s == t || (s == t2)`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If `s == n && n != 31` then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to an UNKNOWN address.

### STXR

For a description of this instruction and the encoding, see *STXR* on page C6-780.

#### *CONSTRAINED UNPREDICTABLE behavior*

If `s == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If `s == n && n != 31` then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to an UNKNOWN address.

### STXRB

For a description of this instruction and the encoding, see *STXRB* on page C6-783.

#### *CONSTRAINED UNPREDICTABLE behavior*

If `s == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If `s == n && n != 31` then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to an UNKNOWN address.

### STXRH

For a description of this instruction and the encoding, see *STXRH* on page C6-786.

#### *CONSTRAINED UNPREDICTABLE behavior*

If `s == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If `s == n && n != 31` then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as a `NOP`.
- The instruction performs the store to an UNKNOWN address.

## K1.2.15 Out of range values of the Set/Way/Index fields in cache maintenance instructions

In the cache maintenance by set/way instructions DC CISW, DC CSW, and DC ISW, if any set/way/index argument is larger than the value supported by the implementation, then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

**Note**

This CONSTRAINED UNPREDICTABLE behavior applies, also, to the AArch32 cache maintenance by set/way instructions DCCISW, DCCSW, and DCISW.

# Appendix K2
# Recommended External Debug Interface

This appendix describes the recommended external debug interface. It contains the following sections:

- *About the recommended external debug interface* on page K2-5516.
- *PMUEVENT bus* on page K2-5519.
- *Recommended authentication interface* on page K2-5520.
- *Management registers and CoreSight compliance* on page K2-5523.

**Note**

This recommended external debug interface specification is not part of the ARM architecture specification. Implementers and users of the ARMv8 architecture must not consider this appendix as a requirement of the architecture. It is included as an appendix to this manual only:

- As reference material for users of ARM products that implement this interface.
- As an example of how an external debug interface might be implemented.

The inclusion of this appendix is no indication of whether any ARM products might, or might not, implement this external debug interface. For details of the implemented external debug interface you must always see the appropriate product documentation.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K2.1 About the recommended external debug interface

See the *Note* on the first page of this appendix for information about the architectural status of this recommended debug interface.

This specification provides a recommended external debug interface for ARMv8 to define a standard set of connections for validation environments. In general, the connection between components, such as between the PE and Trace extension, is not described here, although the table does include the signals for the CTI connection. Table K2-1 shows the signals in the recommended interface.

**Table K2-1 Recommended debug interface signals**

| Name | Direction | Description | Notes |
|---|---|---|---|
| **DBGEN** | In | External debug enable | - |
| **SPIDEN** | In | Secure privileged external debug enable | - |
| | | Secure privileged self-hosted debug enable | Only in Secure AArch32 modes when enabled by MDCR_EL3.SPD32 |
| **NIDEN** | In | External profiling and trace enable | - |
| **SPNIDEN** | In | Secure external profiling and trace enable | - |
| **EDBGRQ** | In | External halt request | Provided for legacy connections only. |
| **DBGACK** | Out | External halt request acknowledge | |
| **COMMIRQ** | Out | DCC interrupt | Interface to an interrupt controller. See *Interrupt-driven use of the DCC* on page H4-4902 and the pseudocode for function `CheckForDCCInterrupts()` in *Pseudocode description of the operation of the DCC and ITR registers* on page H4-4903. |
| **PMUIRQ** | Out | Performance Monitor overflow | Interface to an interrupt controller. See *Behavior on overflow* on page D5-1861. |
| **COMMRX** | Out | DTRRX is full | Provided for legacy connection to an interrupt controller only. See *Interrupt-driven use of the DCC* on page H4-4902 and the pseudocode for function `CheckForDCCInterrupts()` in *Pseudocode description of the operation of the DCC and ITR registers* on page H4-4903. |
| **COMMTX** | Out | DTRTX is empty | |
| **PMUEVENT[n:0]** | Out | Performance Monitors event bus | See *PMUEVENT bus* on page K2-5519. |
| **DBGNOPWRDWN** | Out | Core no powerdown request | Interface to a power controller. See DBGPRCR_EL1.CORENPDRQ. |
| **DBGPWRUPREQ** | Out | Core powerup request | Interface to a power controller. See EDPRCR.COREPURQ. |
| **DBGRSTREQ** | Out | Warm reset request | Interface to a power controller. See EDPRCR.CWRR. |
| **DBGBUSCANCELREQ** | Out | All asynchronous entry to Debug state | Extension to the bus interface. See EDRCR.CBRRQ. |

## K2.2 PMUEVENT bus

The **PMUEVENT** bus exports Performance Monitor events from the PE to an on-chip agent. ARM recommends that it has the following characteristics:

- The bus is synchronous.
- The width of the bus is IMPLEMENTATION DEFINED.
- It is IMPLEMENTATION DEFINED which events are exported on the bus.
- Each exported event occupies a contiguous sub-field of the bus. ARM recommends that the sub-fields of the bus are occupied in the same order as the event numbers.
- If the event can only occur once per cycle, it occupies a single bit. If the event can occur more than once per cycle, it is IMPLEMENTATION DEFINED how the event is encoded. The encoding depends on constraints such as the designated use of the event bus and the number of pins available. For example, the event can be encoded:
  - As a count, using a plain binary number. This is the most useful encoding when exporting to an external counter. It is not a useful encoding for exporting to a Trace extension external input.
  - As a count, using thermometer encoding. This is the most useful encoding when exporting to a Trace extension.
  - Using a single bit encoding to indicate whether the event count is zero or nonzero. This is useful for exporting to an activity monitor where the number of pins is constrained.

If a Trace extension is implemented, the **PMUEVENT** bus is normally connected to the Trace extension using the external inputs. TRCEXTINSELR multiplexes a wide **PMUEVENT** bus to a narrow set of inputs. An external **PMUEVENT** bus might also be provided. For more information, contact ARM.

## K2.3 Recommended authentication interface

The details of the debug authentication interface are IMPLEMENTATION DEFINED.

ARM recommends the use of the CoreSight interface, which has four signals for external debug authentication:

- **DBGEN**,
- **SPIDEN**.
- **NIDEN**.
- **SPNIDEN**.

CoreSight forbids asserting **SPIDEN** without also asserting **DBGEN**. CoreSight also forbids asserting **SPNIDEN** without also asserting **NIDEN**.

ARM recommends an interface in which **DBGEN** and **SPIDEN** are also used for self-hosted secure debug authentication if either:

- EL3 is using AArch32 and SDCR.SPD == `0b00`.
- Secure EL1 is using AArch32 and MDCR_EL3.SPD32 == `0b00`.

If EL3 is not implemented and the PE is in Non-secure state, **SPIDEN** and **SPNIDEN** are not implemented, and the PE behaves as if these signals were tied LOW.

If EL3 is not implemented and the PE is in Secure state, **SPIDEN** is usually connected to **DBGEN** and **SPNIDEN** is connected to **NIDEN**, but this is not required. The recommended interface is defined as if all four signals are implemented.

How the authentication signals are driven is IMPLEMENTATION DEFINED. For example, the signals might be hard-wired, connected to fuses, or to an authentication module. The architecture permits PEs within a cluster to have independent authentication interfaces, but this is not required. ARM recommends that any Trace extension has the same authentication interface as the PE it is connected to.

Table K2-2 shows the debug authentication pseudocode functions and the recommended implementations.

**Table K2-2 Recommended implementation of debug enable pseudocode functions**

| Pseudocode function | Description | Implementation |
|---|---|---|
| `SelfHostedSecurePrivilegedInvasiveDebugEnabled()`<br>See *Pseudocode description of AArch32 Self-Hosted Secure Privileged Invasive Debug Enabled* on page K2-5521 | Secure invasive self-hosted debug enabled in AArch32 state (legacy) | (**DBGEN** AND **SPIDEN**) |
| `ExternalSecureNoninvasiveDebugEnabled()`<br>See *Pseudocode description of External Invasive Debug Enabled* on page K2-5521 | Secure non-invasive debug enabled | (**DBGEN** OR **NIDEN**) AND (**SPIDEN** OR **SPNIDEN**) |
| `ExternalSecureInvasiveDebugEnabled()`<br>See *Pseudocode description of External Secure Invasive Debug Enabled* on page K2-5521 | Secure invasive debug enabled | (**DBGEN** AND **SPIDEN**) |
| `ExternalNoninvasiveDebugEnabled()`<br>See *Pseudocode description of External Non-invasive Debug Enabled* on page K2-5521 | Non-secure non-invasive debug enabled | (**DBGEN** OR **NIDEN**) |
| `ExternalInvasiveDebugEnabled()`<br>See *Pseudocode description of External Secure Non-invasive Debug Enabled* on page K2-5522 | Non-secure invasive debug enabled | **DBGEN** |

The following assertions must apply to all implementations:

if `!ExternalInvasiveDebugEnabled()` then assert `!ExternalSecureInvasiveDebugEnabled()`

if `!ExternalNoninvasiveDebugEnabled()` then assert `!ExternalSecureNoninvasiveDebugEnabled()`

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

if `ExternalInvasiveDebugEnabled()` then assert `ExternalNoninvasiveDebugEnabled()`

if `ExternalSecureInvasiveDebugEnabled()` then assert `ExternalSecureNoninvasiveDebugEnabled()`

The definition for the `Debug_authentication()` function is as follows:

```
signal DBGEN;
signal NIDEN;
signal SPIDEN;
signal SPNIDEN;
```

### K2.3.1 Pseudocode description of AArch32 Self-Hosted Secure Privileged Invasive Debug Enabled

The pseudocode for the `SelfHostedSecurePrivilegedInvasiveDebugEnabled()` function is as follows:

```
// AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()
// ========================================================

boolean AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()
    // In the recommended interface, SelfHostedSecurePrivilegedInvasiveDebugEnabled returns
    // the state of the (DBGEN AND SPIDEN) signal.
    if !HaveEL(EL3) && !IsSecure() then return FALSE;
    return DBGEN == HIGH && SPIDEN == HIGH;
```

### K2.3.2 Pseudocode description of External Invasive Debug Enabled

The pseudocode for the `ExternalInvasiveDebugEnabled()` function is as follows:

```
// ExternalInvasiveDebugEnabled()
// ==============================

boolean ExternalInvasiveDebugEnabled()
    // In the recommended interface, ExternalInvasiveDebugEnabled returns the state of the DBGEN
    // signal.
    return DBGEN == HIGH;
```

### K2.3.3 Pseudocode description of External Secure Invasive Debug Enabled

The pseudocode for the `ExternalSecureInvasiveDebugEnabled()` function is as follows:

```
// ExternalSecureInvasiveDebugEnabled()
// ====================================

boolean ExternalSecureInvasiveDebugEnabled()
    // In the recommended interface, ExternalSecureInvasiveDebugEnabled returns the state of the
    // (DBGEN AND SPIDEN) signal.
    // CoreSight allows asserting SPIDEN without also asserting DBGEN, but this is not recommended.
    if !HaveEL(EL3) && !IsSecure() then return FALSE;
    return ExternalInvasiveDebugEnabled() && SPIDEN == HIGH;
```

### K2.3.4 Pseudocode description of External Non-invasive Debug Enabled

The pseudocode for the `ExternalNoninvasiveDebugEnabled()` function is as follows:

```
// ExternalNoninvasiveDebugEnabled()
// =================================

boolean ExternalNoninvasiveDebugEnabled()
    // In the recommended interface, ExternalNoninvasiveDebugEnabled returns the state of the (DBGEN
    // OR NIDEN) signal.
    return ExternalInvasiveDebugEnabled() || NIDEN == HIGH;
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### K2.3.5 Pseudocode description of External Secure Non-invasive Debug Enabled

The pseudocode for the `ExternalSecureNoninvasiveDebugEnabled()` function is as follows:

```
// ExternalSecureNoninvasiveDebugEnabled()
// =======================================

boolean ExternalSecureNoninvasiveDebugEnabled()
    // In the recommended interface, ExternalSecureNoninvasiveDebugEnabled returns the state of the
    // (DBGEN OR NIDEN) AND (SPIDEN OR SPNIDEN) signal.
    if !HaveEL(EL3) && !IsSecure() then return FALSE;
    return ExternalNoninvasiveDebugEnabled() && (SPIDEN == HIGH || SPNIDEN == HIGH);
```

*Non-Confidential - Beta*

## K2.4 Management registers and CoreSight compliance

The CoreSight architecture requires the implementation of a set of management registers that occupy the memory map from `0xF00` upwards in each of the debug components.

CoreSight compliance and complete implementation of the management registers is OPTIONAL, but ARM recommends that the registers are implemented.

The CoreSight architecture specification recommends that any integration test registers are implemented starting from `0xEFC` downwards. Each of the debug components has an IMPLEMENTATION DEFINED region from `0xE80` to `0xEFC` for this purpose.

### K2.4.1 Coresight interface register map

Table K2-3 shows the external management register maps for the following registers:

**ED** These are the external debug register.

**CTI** These are the Cross-trigger interface registers.

**PMU** These are the Performance Monitors registers.

**Table K2-3 Coresight interface register map**

| Offset | Mnemonic | | | Name |
|---|---|---|---|---|
| | ED | CTI | PMU | |
| 0xF00 | EDITCTRL | CTIITCTRL | PMITCTRL | Integration Model Control registers |
| 0xF04-0xF9C | - | - | - | Reserved, RES0 |
| 0xFA0 | DBGCLAIMSET_EL1[a] | CTICLAIMSET[b] | - | CLAIM Tag Set registers |
| 0xFA4 | DBGCLAIMCLR_EL1[a] | CTICLAIMCLR[b] | - | CLAIM Tag Clear registers |
| 0xFA8 | EDDEVAFF0[a] | CTIDEVAFF0[c] | PMDEVAFF0 | Device Affinity registers |
| 0xFAC | EDDEVAFF1[a] | CTIDEVAFF1[c] | PMDEVAFF1 | |
| 0xFB0 | EDLAR[d] | CTILAR[d] | PMLAR[d] | Lock Access register |
| 0xFB4 | EDLSR[d] | CTILSR[d] | PMLSR[d] | Lock Status register |
| 0XFB8 | DBGAUTHSTATUS_EL1[a] | CTIAUTHSTATUS | PMAUTHSTATUS | Authentication Status register |
| 0xFBC | EDDEVARCH | CTIDEVARCH | PMDEVARCH | Device Architecture register |
| 0xFC0 | EDDEVID2[a] | CTIDEVID2[a] | - | Device ID register |
| 0xFC4 | EDDEVID1[a] | CTIDEVID1[a] | - | |
| 0xFC8 | EDDEVID[a] | CTIDEVID[a] | - | |
| 0xFCC | EDDEVTYPE | CTIDEVTYPE | PMDEVTYPE | Device Type register |
| 0xFD0 | EDPIDR4 | CTIPIDR4 | PMPIDR4 | Peripheral ID registers |
| 0xFD4-0xFDC | - | - | - | Reserved, RES0 |
| 0xFE0 | EDPIDR0 | CTIPIDR0 | PMPIDR0 | Peripheral ID registers |
| 0xFE4 | EDPIDR1 | CTIPIDR1 | PMPIDR1 | |
| 0xFE8 | EDPIDR2 | CTIPIDR2 | PMPIDR2 | |
| 0xFEC | EDPIDR3 | CTIPIDR3 | PMPIDR3 | |

Non-Confidential - Beta

**Table K2-3 Coresight interface register map (continued)**

| Offset | Mnemonic | | | Name |
|---|---|---|---|---|
| | ED | CTI | PMU | |
| 0xFF0 | EDCIDR0 | CTICIDR0 | PMCIDR0 | Component ID registers |
| 0xFF4 | EDCIDR1 | CTICIDR1 | PMCIDR1 | |
| 0xFF8 | EDCIDR2 | CTICIDR2 | PMCIDR2 | |
| 0xFFC | EDCIDR3 | CTICIDR3 | PMCIDR3 | |

a. This register must always be implemented, regardless of whether the component is CoreSight compliant.
b. If implemented, the number of CLAIM bits is IMPLEMENTATION DEFINED and can be discovered by reading CLAIMSET.
c. If the CTI implements CTIv1, this register is not implemented. See the register description for details.
d. The Software lock registers are defined as part of CoreSight compliance, but their contents depend on the type of access that is made and whether the OPTIONAL Software lock is implemented. See the register description for details.

### K2.4.2 Management register access permissions

Access to the OPTIONAL Integration Control register (ITCTRL) is IMPLEMENTATION DEFINED.

If the Debug power domain is off, all register accesses return an error.

Otherwise, Table K2-4 on page K2-5525, Table K2-5 on page K2-5526, and Table K2-6 on page K2-5527 show the response to accesses by the external debug interface to the CoreSight management registers. For definitions of the terms used in the tables, see *External debug interface register access permissions summary* on page H8-4954.

**Note**

Access to the CoreSight management registers is not affected by the values of EDAD and EPMAD.

Table K2-4 on page K2-5525, Table K2-5 on page K2-5526, and Table K2-6 on page K2-5527 include reserved management registers, because the CoreSight architecture requires that these registers are always RES0. The descriptions in *Reserved and unallocated registers* on page H8-4954 does not apply to reserved management registers if the implementation is CoreSight compliant.

If OPTIONAL memory-mapped access to the external debug interface is supported, there are additional constraints on memory-mapped accesses. See *Register access permissions for memory-mapped accesses* on page H8-4950.

The terms in Table K2-4 on page K2-5525, Table K2-5 on page K2-5526, and Table K2-6 on page K2-5527 are defined as follows:

**Domain** This describes the power domain in which the register is logically implemented. Registers described as implemented in the Core power domain might be implemented in the Debug power domain, as long as they exhibit the required behavior.

**Conditions** This lists the conditions under which the access is attempted.

To determine the access permissions for a register, read these columns from left to right, and stop at first column which lists the condition as being true.

The conditions are:

**Off** EDPRSR.PU == 0. The Core power domain is completely off, or in low-power state. In these cases the Core power domain registers cannot be accessed.

**Note**

If debug power is off, then all external debug interface accesses return an error.

**DLK** `DoubleLockStatus()` == TRUE. The OS Double Lock is locked, that is, EDPRSR.DLK == 1.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**OSLK** OSLSR.OSLK == 1. The OS Lock is locked.

**Default** This provides the default access permissions, if there are no conditions that prevent access to the register.

**SLK** This provides the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the OPTIONAL Software Lock is locked. See *Register access permissions for memory-mapped accesses* on page H8-4950. For all other accesses, this column is ignored.

The access permissions are:

**-** This means that the default access permission applies. See the Default column, or the SLK column, if applicable.

**RO** This means that the register or field is read-only.

**RW** This means that the register or field is read/write. Individual fields within the register might be RO. See the relevant register description for details.

**RC** This means that the bit clears to 0 after a read.

**(SE)** This means that accesses to this register have indirect write side effects. Aside effect occurs when a direct read or a direct write of a register creates an indirect write to the same register or to another register.

**WO** This means that the register or field is write-only.

**WI** This means that the register or field ignores writes.

**IMP DEF** This means that the access permissions are IMPLEMENTATION DEFINED.

**Table K2-4 External debug interface access permissions, CoreSight registers (debug)**

| Offset | Register | Domain | Conditions (priority left to right) | | | Default | SLK |
|---|---|---|---|---|---|---|---|
| | | | Off | DLK | OSLK | | |

### K2.4.3 Management register resets

Table K2-7 shows the management register resets. This table does not include:

- Read-only identification registers that have a fixed value from reset. These registers include those with the DEVAFFn, DEVARCH, DEVID{n}, DEVTYPE, PIDRn, and CIDRn mnemonics.
- Registers that have the AUTHSTATUS mnemonic. This is a read-only status register that reflects the status outside of the reset domain of the register.
- Registers that have the LAR mnemonic. These are write-only registers that only have an effect on writes.

All other fields in the management registers are reset to an IMPLEMENTATION DEFINED value which can be UNKNOWN. The registers are in the reset domain specified in the table.

Table K2-7 shows a summary of the management register resets.

**Table K2-7 Management register resets**

| Register | Reset domain | Field | Value | Description |
|---|---|---|---|---|
| CTIITCTRL<br>EDITCTRL<br>PMITCTRL | IMPLEMENTATION DEFINED | IME | 0 | Integration mode enable |
| DBGCLAIMCLR_EL1 | Cold reset | CLAIM | 0x00 | CLAIM tags |

# Appendix K3
# Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events

This appendix describes the ARM recommendations for the use of the IMPLEMENTATION DEFINED event numbers. It contains the following sections:

- *ARM recommendations for IMPLEMENTATION DEFINED event numbers* on page K3-5530.
- *Summary of events for exceptions taken to an Exception Level using AArch64* on page K3-5544.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K3.1 ARM recommendations for IMPLEMENTATION DEFINED event numbers

These are the ARM recommendations for the use of the IMPLEMENTATION DEFINED event numbers. ARM does not define these events as rigorously as those in the architectural and microarchitectural event lists, and an implementation might:

- Modify the definition of an event to better correspond to the implementation.
- Not use some, or many, of these event numbers.
- Include cumulative occupancy for resource queues such as data access queues, and entry/exit counts, so that average latencies can be determined and counts for key resources that might exist can be separated.
- Provide registers in the IMPLEMENTATION DEFINED space to further extend such counts by, for example, specifying a minimum latency for an event to be counted.
- Use cumulative occupancy for resource queues, such as data access queues, and entry/exit counts, so that average latencies can be determined, separating out counts for key resources that might exist:
  - An implementation might also provide registers in the IMPLEMENTATION DEFINED space to further extend such counts, by, for example specifying a minimum latency for an event to be counted.

Table K3-1 lists the PMU IMPLEMENTATION DEFINED event numbers in event number order.

**Table K3-1 PMU IMPLEMENTATION DEFINED event numbers**

| Event number | Event mnemonic | Description |
|---|---|---|
| 0x040 | L1D_CACHE_RD | Level 1 data cache access, read |
| 0x041 | L1D_CACHE_WR | Level 1 data cache access, write |
| 0x042 | L1D_CACHE_REFILL_RD[a] | Level 1 data cache refill, read |
| 0x043 | L1D_CACHE_REFILL_WR[a] | Level 1 data cache refill, write |
| 0x044 | L1D_CACHE_REFILL_INNER | Level 1 data cache refill, inner |
| 0x045 | L1D_CACHE_REFILL_OUTER | Level 1 data cache refill, outer |
| 0x046 | L1D_CACHE_WB_VICTIM | Level 1 data cache write-back, victim |
| 0x047 | L1D_CACHE_WB_CLEAN | Level 1 data cache write-back, cleaning and coherency |
| 0x048 | L1D_CACHE_INVAL | Level 1 data cache invalidate |
| 0x049-0x04B | - | Reserved |
| 0x04C | L1D_TLB_REFILL_RD[a] | Level 1 data TLB refill, read |
| 0x04D | L1D_TLB_REFILL_WR[a] | Level 1 data TLB refill, write |
| 0x04E | L1D_TLB_RD | Level 1 data or unified TLB access, read |
| 0x04F | L1D_TLB_WR | Level 1 data or unified TLB access, write |
| 0x050 | L2D_CACHE_RD | Level 2 data cache access, read |
| 0x051 | L2D_CACHE_WR | Level 2 data cache access, write |
| 0x052 | L2D_CACHE_REFILL_RD[a] | Level 2 data cache refill, read |
| 0x053 | L2D_CACHE_REFILL_WR[a] | Level 2 data cache refill, write |
| 0x054-0x055 | - | Reserved |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**Table K3-1 PMU IMPLEMENTATION DEFINED event numbers (continued)**

| Event number | Event mnemonic | Description |
|---|---|---|
| 0x056 | L2D_CACHE_WB_VICTIM | Level 2 data cache write-back, victim |
| 0x057 | L2D_CACHE_WB_CLEAN | Level 2 data cache write-back, cleaning and coherency |
| 0x058 | L2D_CACHE_INVAL | Level 2 data cache invalidate |
| 0x059-0x05B | - | Reserved |
| 0x05C | L2D_TLB_REFILL_RD[a] | Attributable Level 2 data or unified TLB refill, read |
| 0x05D | L2D_TLB_REFILL_WR[a] | Attributable Level 2 data or unified TLB refill, write |
| 0x05E | L2D_TLB_RD | Attributable Level 2 data or unified TLB access, read |
| 0x05F | L2D_TLB_WR | Attributable Level 2 data or unified TLB access, write |
| 0x060 | BUS_ACCESS_RD | Bus access, read |
| 0x061 | BUS_ACCESS_WR | Bus access, write |
| 0x062 | BUS_ACCESS_SHARED | Bus access, Normal, Cacheable, Shareable |
| 0x063 | BUS_ACCESS_NOT_SHARED | Bus access, not Normal, Cacheable, Shareable |
| 0x064 | BUS_ACCESS_NORMAL | Bus access, normal |
| 0x065 | BUS_ACCESS_PERIPH | Bus access, peripheral |
| 0x066 | MEM_ACCESS_RD | Data memory access, read |
| 0x067 | MEM_ACCESS_WR | Data memory access, write |
| 0x068 | UNALIGNED_LD_SPEC | Unaligned access, read |
| 0x069 | UNALIGNED_ST_SPEC | Unaligned access, write |
| 0x06A | UNALIGNED_LDST_SPEC | Unaligned access |
| 0x06B | - | Reserved |
| 0x06C | LDREX_SPEC | Exclusive operation speculatively executed, LDREX or LDX |
| 0x06D | STREX_PASS_SPEC | Exclusive operation speculatively executed, STREX or STX pass |
| 0x06E | STREX_FAIL_SPEC | Exclusive operation speculatively executed, STREX or STX pass |
| 0x06F | STREX_SPEC | Exclusive operation speculatively executed, STREX or STX |
| 0x070 | LD_SPEC | Operation speculatively executed, load |
| 0x071 | ST_SPEC | Operation speculatively executed, store |
| 0x072 | LDST_SPEC | Operation speculatively executed, load or store |
| 0x073 | DP_SPEC | Operation speculatively executed, integer data-processing |
| 0x074 | ASE_SPEC | Operation speculatively executed, Advanced SIMD instruction |
| 0x075 | VFP_SPEC | Operation speculatively executed, floating-point instruction |
| 0x076 | PC_WRITE_SPEC | Operation speculatively executed, software change of the PC |
| 0x077 | CRYPTO_SPEC | Operation speculatively executed, Cryptographic instruction |

**Table K3-1 PMU IMPLEMENTATION DEFINED event numbers (continued)**

| Event number | Event mnemonic | Description |
|---|---|---|
| 0x078 | BR_IMMED_SPEC | Branch speculatively executed, immediate branch |
| 0x079 | BR_RETURN_SPEC | Branch speculatively executed, procedure return |
| 0x07A | BR_INDIRECT_SPEC | Branch speculatively executed, indirect branch |
| 0x07B | - | Reserved |
| 0x07C | ISB_SPEC | Barrier speculatively executed, ISB |
| 0x07D | DSB_SPEC | Barrier speculatively executed, DSB |
| 0x07E | DMB_SPEC | Barrier speculatively executed, DMB |
| 0x07F-0x080 | - | Reserved |
| 0x081 | EXC_UNDEF | Exception taken, Other synchronous |
| 0x082 | EXC_SVC | Exception taken, Supervisor Call |
| 0x083 | EXC_PABORT | Exception taken, Instruction Abort |
| 0x084 | EXC_DABORT | Exception taken, Data Abort and SError |
| 0x085 | - | Reserved |
| 0x086 | EXC_IRQ | Exception taken, IRQ |
| 0x087 | EXC_FIQ | Exception taken, FIQ |
| 0x088 | EXC_SMC | Exception taken, Secure Monitor Call |
| 0x089 | - | Reserved |
| 0x08A | EXC_HVC | Exception taken, Hypervisor Call |
| 0x08B | EXC_TRAP_PABORT | Exception taken, Instruction Abort not taken locally |
| 0x08C | EXC_TRAP_DABORT | Exception taken, Data Abort or SError not taken locally |
| 0x08D | EXC_TRAP_OTHER | Exception taken, Other traps not taken locally |
| 0x08E | EXC_TRAP_IRQ | Exception taken, IRQ not taken locally |
| 0x08F | EXC_TRAP_FIQ | Exception taken, FIQ not taken locally |
| 0x090 | RC_LD_SPEC | Release consistency operation speculatively executed, Load-Acquire |
| 0x091 | RC_ST_SPEC | Release consistency operation speculatively executed, Store-Release |
| 0x092-0x09F | - | Reserved |
| 0x0A0 | L3D_CACHE_RD | Attributable Level 3 data or unified cache access, read |
| 0x0A1 | L3D_CACHE_WR | Attributable Level 3 data or unified cache access, write |
| 0x0A2 | L3D_CACHE_REFILL_RD[a] | Attributable Level 3 data or unified cache refill, read |
| 0x0A3 | L3D_CACHE_REFILL_WR[a] | Attributable Level 3 data or unified cache refill, write |
| 0x0A4-0x0A5 | - | Reserved |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**Table K3-1 PMU IMPLEMENTATION DEFINED event numbers (continued)**

| Event number | Event mnemonic | Description |
|---|---|---|
| 0x0A6 | L3D_CACHE_WB_VICTIM | Attributable Level 3 data or unified cache write-back, victim |
| 0x0A7 | L3D_CACHE_WB_CLEAN | Attributable Level 3 data or unified cache write-back, cache clean |
| 0x0A8 | L3D_CACHE_INVAL | Attributable Level 3 data or unified cache access, invalidate |

a. For more information, see *Relationship between REFILL events and associated access events* on page K3-5543.

**0x040, L1D_CACHE_RD, Level 1 data cache access, read**

This event is similar to Level 1 data cache access, L1D_CACHE, but the counter counts only memory-read operations that access at least the Level 1 data or unified cache.

**0x041, L1D_CACHE_WR, Level 1 data cache access, write**

This event is similar to Level 1 data cache access, L1D_CACHE, but the counter counts only memory-write operations that access at least the Level 1 data or unified cache.

The counter counts DC ZVA as a store instruction.

**0x042, L1D_CACHE_REFILL_RD, Level 1 data cache refill, read**

This event is similar to Level 1 data cache refill, L1D_CACHE_REFILL, but the counter counts only memory-read operations that cause a refill of at least the Level 1 data or unified cache.

See also *Relationship between REFILL events and associated access events.* on page K3-5543.

**0x043, L1D_CACHE_REFILL_WR, Level 1 data cache refill, write**

This event is similar to Level 1 data cache refill, L1D_CACHE_REFILL, but the counter counts only memory-write operations that cause a refill of at least the Level 1 data or unified cache.

The counter counts DC ZVA as a store instruction.

See also *Relationship between REFILL events and associated access events.* on page K3-5543.

**0x044, L1D_CACHE_REFILL_INNER, Level 1 data cache refill, inner**

This event is similar to Level 1 data cache refill, L1D_CACHE_REFILL, but the counter counts only memory-read and memory-write operations that generate refills satisfied by transfer from another cache inside of the immediate cluster.

**Note**

The boundary between *inner* and *outer* is IMPLEMENTATION DEFINED, and it is not necessarily linked to other similar boundaries, such as the boundary between Inner Cacheable and Outer Cacheable or the boundary between Inner Shareable and Outer Shareable.

**0x045, L1D_CACHE_REFILL_OUTER, Level 1 data cache refill, outer**

This event is similar to Level 1 data cache refill, L1D_CACHE_REFILL, but the counter counts only memory-read and memory-write operations that generate refills satisfied from outside of the immediate cluster.

**0x046, L1D_CACHE_WB_VICTIM, Attributable Level 1 data cache write-back, victim**

This event is similar to Level 1 data cache write-back, L1D_CACHE_WB, but the counter counts only write-backs that are a result of the line being allocated for an access made by the PE.

Write-backs caused by the execution of a cache maintenance instruction are not counted.

It is IMPLEMENTATION DEFINED whether a write of a whole cache line that is not the result of the eviction of a line from the cache is counted. For example, this might occur if the PE detects streaming writes to memory and does not allocate lines to the cache, or as the result of a DC ZVA.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**0x047, L1D_CACHE_WB_CLEAN, Attributable Level 1 data cache write-back, cleaning and coherency**

This event is similar to Level 1 data cache write-back, L1D_CACHE_WB, but the counter counts only write-backs that are a result of a coherency operation made by another PE or are caused by the execution of a cache maintenance instruction. Whether write-backs caused by the execution of a cache maintenance instruction are counted is IMPLEMENTATION DEFINED.

If a coherency request from a requestor outside the PE results in a write-back, it is an Unattributable event.

**Note**

The transfer of a dirty cache line from the Level 1 data cache of this PE to the Level 1 data cache of another PE due to a hardware coherency operation is not counted unless the dirty cache line is also written back to a Level 2 cache or memory.

**0x048, L1D_CACHE_INVAL, Level 1 data cache invalidate**

The counter counts each invalidation of a cache line in the Level 1 data or unified cache.

The counter does not count events:

- If a cache refill invalidates a line.
- For locally-executed cache maintenance instructions that operate by set/way.

If a coherency request from a requestor outside the PE results in a write-back, it is an Unattributable event.

**0x04C, L1D_TLB_REFILL_RD, Level 1 data TLB refill, read**

This event is similar to Level 1 data TLB refill, L1D_TLB_REFILL, but the counter counts only memory-read operations that cause a data TLB refill of a least the Level 1 data or unified TLB.

See also *Relationship between REFILL events and associated access events.* on page K3-5543.

**0x04D, L1D_TLB_REFILL_WR, Level 1 data TLB refill, write**

This event is similar to Level 1 data TLB refill, L1D_TLB_REFILL, but the counter counts only memory-write operations that cause a data TLB refill of a least the Level 1 data or unified TLB.

The counter counts DC ZVA as a store instruction.

See also *Relationship between REFILL events and associated access events.* on page K3-5543.

**0x04E, L1D_TLB_RD, Level 1 data or unified TLB access, read**

This event is similar to Level 1 data or unified TLB access, L1D_TLB, but the counter counts only memory-read operations that cause a TLB access to at least the Level 1 data or unified TLB.

**0x04F, L1D_TLB_WR, Level 1 data or unified TLB access, write**

This event is similar to Level 1 data or unified TLB access, L1D_TLB, but the counter counts only memory-write operations that cause a TLB access to at least the Level 1 data or unified TLB.

**0x050, L2D_CACHE_RD, Level 2 data cache access, read**

This event is similar to Level 2 data cache access, L2D_CACHE, but the counter counts only memory-read operations that access at least the Level 2 data or unified cache.

**0x051, L2D_CACHE_WR, Level 2 data cache access, write**

This event is similar to Level 2 data cache access, L2D_CACHE, but the counter counts only memory-write operations that access at least the Level 2 data or unified cache.

The counter counts DC ZVA as a store instruction.

**0x052, L2D_CACHE_REFILL_RD, Level 2 data cache refill, read**

This event is similar to Level 2 data cache refill, L2D_CACHE_REFILL, but the counter counts only memory-read operations that cause a refill of at least the Level 2 data or unified cache.

See also *Relationship between REFILL events and associated access events.* on page K3-5543.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**0x053, L2D_CACHE_REFILL_WR, Level 2 data cache refill, write**

This event is similar to Level 2 data cache refill, L2D_CACHE_REFILL, but the counter counts only memory-write operations that cause a refill of at least the Level 2 data or unified cache.

The counter counts DC ZVA as a store instruction.

See also *Relationship between REFILL events and associated access events.* on page K3-5543.

**0x056, L2D_CACHE_WB_VICTIM, Attributable Level 2 data cache write-back, victim**

This event is similar to Level 2 data cache write-back, L2D_CACHE_WB, but the counter counts only write-backs that are a result of the line being allocated for an access made by the PE.

Write-backs caused by the execution of a cache maintenance instruction are not counted.

It is IMPLEMENTATION DEFINED whether a write of a whole cache line that is not the result of the eviction of a line from the cache is counted. For example, this might occur if the PE detects streaming writes to memory and does not allocate lines to the cache, or as the result of a DC ZVA.

**0x057, L2D_CACHE_WB_CLEAN, Attributable Level 2 data cache write-back, cleaning and coherency**

This event is similar to Level 2 data cache write-back, L2D_CACHE_WB, but the counter counts only write-backs that are a result of a coherency operation made by another PE or are caused by the execution of a cache maintenance instruction. Whether write-backs caused by the execution of a cache maintenance instruction are counted as IMPLEMENTATION DEFINED.

**Note**

The transfer of a dirty cache line from the Level 2 data cache of this PE to the Level 2 data cache of another PE due to a hardware coherency operation is not counted unless the dirty cache line is also written back to a Level 3 cache or memory.

If a coherency request from a requestor outside the PE results in a write-back, it is an Unattributable event.

**0x058, L2D_CACHE_INVAL, Level 2 data cache invalidate**

The counter counts each invalidation of a cache line in the Level 2 data or unified cache.

The counter does not count events:

- If a cache refill invalidates a line.
- For locally executed cache maintenance instructions that operate by set/way.

**Note**

Software that uses this event must know whether the Level 2 data cache is shared with other PEs. This event does not follow the general rule of Level 2 data cache events of only counting events that directly affect this PE.

If a coherency request from a requestor outside the PE results in a write-back, it is an Unattributable event.

**0x05C, L2D_TLB_REFILL_RD, Attributable Level 2 data or unified TLB refill, read**

This event is similar to Attributable Level 2 data or unified TLB refill, L2D_TLB_REFILL, but the counter counts only Attributable memory read operations that cause a TLB refill of at least the Level 2 data or unified TLB. See also *Relationship between REFILL events and associated access events.* on page K3-5543.

**0x05D, L2D_TLB_REFILL_WR, Attributable Level 2 data or unified TLB refill, write**

This event is similar to Attributable Level 2 data or unified TLB refill, L2D_TLB_REFILL, but the counter counts only Attributable memory write operations that cause a TLB refill of at least the Level 2 data or unified TLB. See also *Relationship between REFILL events and associated access events.* on page K3-5543.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**0x05E, L2D_TLB_RD, Attributable Level 2 data or unified TLB access, read**

This event is similar to Attributable Level 2 data or unified TLB access, L2D_TLB, but the counter counts only Attributable memory read operations that cause a TLB access to at least the Level 2 data or unified TLB.

**0x05F, L2D_TLB_WR, Attributable Level 2 data or unified TLB access, write**

This event is similar to Attributable Level 2 data or unified TLB access, L2D_TLB, but the counter counts only Attributable memory write operations that cause a TLB access to at least the Level 2 data or unified TLB.

**0x060, BUS_ACCESS_RD, Bus access, read**

This event is similar to Bus access, BUS_ACCESS, but the counter counts only memory-read operations that access outside the boundary of the PE and its closely-coupled caches.

**0x061, BUS_ACCESS_WR, Bus access, write**

This event is similar to Bus access, BUS_ACCESS, but the counter counts only memory-write operations that access outside the boundary of the PE and its closely-coupled caches.

**0x062, BUS_ACCESS_SHARED, Bus access, Normal, Cacheable, Shareable**

This event is similar to Bus access, BUS_ACCESS, but the counter counts only memory-read and memory-write operations that make Normal, Cacheable, Shareable accesses outside the boundary of the PE and its closely-coupled caches.

**Note**

It is IMPLEMENTATION DEFINED how the PE translates the attributes from the translation table entry for a region to the attributes on the bus.

In particular, a region of memory designated as Normal, Cacheable, Inner Shareable, Not Outer Shareable by a translation table entry, might be marked as either shareable or Non-shareable at the boundary of the PE and its closely-coupled caches. This depends on where the IMPLEMENTATION DEFINED boundary lies, between Inner and Outer Shareable.

If the Inner Shareable extends beyond the PE boundary, and the bus indicates the distinction between Inner and Outer Shareable, then either is counted as shareable for the purposes of defining this event.

**0x063, BUS_ACCESS_NOT_SHARED, Bus access, not Normal, Cacheable, Shareable**

This event is similar to Bus access, BUS_ACCESS, but the counter counts only memory-read and memory-write operations that make accesses outside the boundary of the PE and its closely-coupled caches that are not Normal, Cacheable, Shareable. For example, the counter counts accesses marked as:

- Normal, Cacheable, Non-shareable.
- Normal, Non-cacheable.
- Device.

**Note**

It is IMPLEMENTATION DEFINED, how the PE translates the attributes from the translation table entries for a region to the attributes on the bus.

In particular, a region of memory designated as Normal, Cacheable, Inner Shareable, Not Outer Shareable by a translation table entry, might be marked as either shareable or Non-shareable at the boundary of the PE and its closely-coupled caches. This depends on where the IMPLEMENTATION DEFINED boundary lies, between Inner and Outer Shareable.

If the Inner Shareable extends beyond the PE boundary, and the bus indicates the distinction between Inner and Outer Shareable, then either is counted as shareable for the purposes of defining this event.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**0x064, BUS_ACCESS_NORMAL, Bus access, normal**

This event is similar to Bus access, BUS_ACCESS, but the counter counts only memory-read and memory-write operations that make Normal accesses outside the boundary of the PE and its closely-coupled caches. For example, the counter counts Normal, Cacheable and Normal, Non-cacheable accesses but does not count Device accesses.

**0x065, BUS_ACCESS_PERIPH, Bus access, peripheral**

This event is similar to Bus access, BUS_ACCESS, but the counter counts only memory-read and memory-write operations that make Device accesses outside the boundary of the PE and its closely-coupled caches.

**0x066, MEM_ACCESS_RD, Data memory access, read**

This event is similar to Data memory access, MEM_ACCESS, but the counter counts only memory-read operations that the PE made.

**0x067, MEM_ACCESS_WR, Data memory access, write**

This event is similar to Data memory access, MEM_ACCESS, but the counter counts only memory-write operations made by the PE.

**0x068, UNALIGNED_LD_SPEC. Unaligned access, read**

This event is similar to Data memory access, MEM_ACCESS, but the counter counts only unaligned memory-read operations that the PE made. It also counts unaligned accesses if they are subsequently transposed into multiple aligned accesses.

**0x069, UNALIGNED_ST_SPEC, Unaligned access, write**

This event is similar to Data memory access, MEM_ACCESS, but the counter counts only unaligned memory-read operations that the PE made. It also counts unaligned accesses if they are subsequently transposed into multiple aligned accesses.

**0x06A, UNALIGNED_LDST_SPEC, Unaligned access**

This event is similar to Data memory access, MEM_ACCESS, but the counter counts only unaligned memory-read operations and unaligned memory-write operations that the PE made. It also counts unaligned accesses if they are subsequently transposed into multiple aligned accesses.

**0x06C, LDREX_SPEC, Exclusive operation speculatively executed, Load-Exclusive**

The counter counts Load-Exclusive instructions speculatively executed.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

**0x06D, STREX_PASS_SPEC, Exclusive operation speculatively executed, Store-Exclusive pass**

The counter counts Store-Exclusive instructions speculatively executed that completed a write.

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the LDREX_SPEC event.

**0x06E, STREX_FAIL_SPEC, Exclusive operation speculatively executed, Store-Exclusive fail**

The counter counts Store-Exclusive instructions speculatively executed that fail to complete a write. It is within the IMPLEMENTATION DEFINED definition of speculatively executed whether this includes conditional instructions that fail the condition code check.

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the LDREX_SPEC event.

**0x06F, STREX_SPEC, Exclusive operation speculatively executed, Store-Exclusive**

The counter counts Store-Exclusive instructions speculatively executed.

The definition of speculatively executed is IMPLEMENTATION DEFINED but it must be the same as for the LDREX_SPEC event.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

ARM recommends that this event is implemented if it is not possible to implement the exclusive operation speculatively executed, Store-Exclusive pass, and exclusive operation speculatively executed, Store-Exclusive fail, events with the same degree of speculation as the LDREX_SPEC event.

**`0x070`, LD_SPEC, Operation speculatively executed, load**

This event is similar to Operation speculatively executed, INST_SPEC, but the counter counts only memory-reading instructions, as defined by the LD_RETIRED event.

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the INST_SPEC event.

**`0x071`, ST_SPEC, Operation speculatively executed, store**

This event is similar to Operation speculatively executed, INST_SPEC, but the counter counts only memory-writing instructions, as defined by the ST_RETIRED event.

The counter counts DC ZVA as a store operation.

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the INST_SPEC event.

**`0x072`, LDST_SPEC, Operation speculatively executed, load or store**

This event is similar to Operation speculatively executed, INST_SPEC, but the counter counts only memory-reading instructions and memory-writing instructions, as defined by the LD_RETIRED and ST_RETIRED events.

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the INST_SPEC event.

**`0x073`, DP_SPEC, Operation speculatively executed, integer data-processing**

This event is similar to Operation speculatively executed, INST_SPEC, but counts only integer data-processing instructions. It counts the following operations that operate on the general-purpose registers:

- In AArch64 state, *Data processing - immediate* on page C3-153 and *Data processing - register* on page C3-158.
- In AArch32 state, *Data-processing instructions* on page F1-2412.

This includes `MOV` and `MVN` operations.

This event also counts the following miscellaneous instructions:

- In AArch64 state, *System register instructions* on page C3-140, *System instructions* on page C3-140, and *Hint instructions* on page C3-141.
- In AArch32 state, *PSTATE and banked register access instructions* on page F1-2420, *Banked register access instructions* on page F1-2420, *Miscellaneous instructions* on page F1-2425, other than `ISB` and preloads, and *Coprocessor instructions* on page F1-2427, other than coprocessor load and store instructions.

If the preload instructions `PRFM`, `PLD`, `PLDW`, and `PLI`, do not count as memory-reading instructions then they must count as integer data-processing instructions.

If `ISB`s do not count as software change of the PC then they must count as integer data-processing instructions.

The definition of speculatively executed is IMPLEMENTATION DEFINED, but must be the same as for the INST_SPEC event.

It is IMPLEMENTATION DEFINED whether the following instructions are counted as integer data-processing operations, SIMD operations, or floating-point operations, but ARM recommends that the instructions are all counted as integer data-processing operations:

- For AArch64 state, from the A64 floating-point convert to integer class, operations that move a value between a general-purpose register and a SIMD and floating-point register without type conversion:
  - `FMOV` (general).

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

- For AArch64 state, from the SIMD Move group, operations that move a values between a general-purpose register and an element or elements in a SIMD and floating-point register:
  - `DUP` (general).
  - `SMOV`.
  - `UMOV`.
  - `INS` (general).
- In AArch32 state:
  - `VDUP` (general-purpose register) and all `VMOV` instructions that transfer data between a general-purpose register and a SIMD and floating-point register.
  - `VMRS`.
  - `VMSR`.

**`0x074`, ASE_SPEC, Operation speculatively executed, Advanced SIMD**

This event is similar to Operation speculatively executed, INST_SPEC, but the counter counts only Advanced SIMD data-processing instructions, see:

- For AArch64 state, the SIMD operations listed in *Data processing - SIMD and floating-point* on page C3-165.
- For AArch32 state, *Advanced SIMD data-processing instructions* on page F1-2431.

This includes all operations that operate on the SIMD and floating-point registers, except those that are counted as:

- Integer data-processing operations.
- Floating-point data-processing operations.
- Memory-reading operations.
- Memory-writing operations.
- Cryptographic operations other than `PMULL`, in AArch64 state.
- `VMULL`, in AArch32 state.

Advanced SIMD scalar operations are counted as Advanced SIMD operations, including those which operate on floating-point values. In AArch64 state, `PMULL`, and in AArch32 state, `VMULL` are counted as Advanced SIMD operations.

The definition of speculatively executed is IMPLEMENTATION DEFINED, but must be the same as for the INST_SPEC event.

**`0x075`, VFP_SPEC, Operation speculatively executed, floating-point**

This event is similar to Operation speculatively executed, INST_SPEC, but the counter counts only floating-point data-processing instructions, see:

- In AArch64 state, the floating-point operations listed in *Data processing - SIMD and floating-point* on page C3-165.
- In AArch32 state, *Floating-point data-processing instructions* on page F1-2439.

This includes all operations that operate on the SIMD and floating-point registers as floating-point values, except for SIMD scalar operations and those that are counted as one of:

- Integer data-processing.
- Memory-reading operations.
- Memory-writing operations.

The following instructions that take both an integer register and a floating-point register argument and perform a type conversion (to/from integer or to/from fixed-point), are counted as floating-point data-processing operations:

- In AArch64 state, `FCVT{<mode>}`, `UCVTF`, and `SCVTF`.
- In AArch32, `VCVT<mode>`(floating-point), `VCVT`, `VCVTT`, and `VCVTB`.

The definition of speculatively executed is IMPLEMENTATION DEFINED, but must be the same as for the INST_SPEC event.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

`0x076`**, PC_WRITE_SPEC, Operation speculatively executed, software change of the PC**

This event is similar to Operation speculatively executed, INST_SPEC, but the counter counts only software changes of the PC. Defined by the instruction architecturally executed, condition code check pass, software change of the PC event, see *Common event numbers* on page D5-1875.

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the INST_SPEC event.

See also PC_WRITE_RETIRED.

`0x077`**, CRYPTO_SPEC, Operation speculatively executed, Cryptographic instruction**

This event is similar to Operation speculatively executed, INST_SPEC, but the counter counts only Cryptographic instructions, except `PMULL` and `VMULL`, see *The Cryptographic Extensions* on page C3-182.

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the INST_SPEC event.

`0x078`**, BR_IMMED_SPEC, Branch speculatively executed, immediate branch**

The counter counts immediate branch instructions speculatively executed. Defined by the instruction architecturally executed, immediate branch event, see *Common event numbers* on page D5-1875.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

See also BR_IMMED_RETIRED.

`0x079`**, BR_RETURN_SPEC, Branch speculatively executed, procedure return**

The counter counts procedure return instructions speculatively executed. Defined by the BR_RETURN_RETIRED event.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

See also BR_RETURN_RETIRED.

`0x07A`**, BR_INDIRECT_SPEC, Branch speculatively executed, indirect branch**

The counter counts indirect branch instructions speculatively executed. This includes software change of the PC other than exception-generating instructions and immediate branch instructions.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

`0x07C`**, ISB_SPEC, Barrier speculatively executed,** `ISB`

The counter counts instruction synchronization barrier instructions speculatively executed, including CP15ISB.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

`0x07D`**, DSB_SPEC, Barrier speculatively executed,** `DSB`

The counter counts data synchronization barrier instructions speculatively executed, including CP15DSB.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

`0x07E`**, DMB_SPEC, Barrier speculatively executed,** `DMB`

The counter counts data memory barrier instructions speculatively executed, including CP15DSB. It does not include the implied barrier operations of load/store operations with release consistency semantics.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

`0x081`**, EXC_UNDEF, Exception taken, other synchronous**

This event is similar to Exception taken, EXC_TAKEN, but the counter counts only synchronous exceptions that are not counted by the other Exception taken events. This event counts only exceptions taken locally.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**0x082, EXC_SVC, Exception taken, Supervisor Call**

This event is similar to Exception taken, EXC_TAKEN, but the counter counts only Supervisor Call exceptions. This event counts only exceptions taken locally.

**0x083, EXC_PABORT, Exception taken, Instruction Abort**

This event is similar to Exception taken, EXC_TAKEN, but the counter counts only Instruction Abort exceptions. This event counts only exceptions taken locally.

**0x084, EXC_DABORT, Exception taken, Data Abort or SError**

This event is similar to Exception taken, EXC_TAKEN, but the counter counts only Data Abort or SError interrupt exceptions. The counter counts only exceptions taken locally.

**0x086, EXC_IRQ, Exception taken, IRQ**

This event is similar to Exception taken, EXC_TAKEN, but the counter counts only IRQ exceptions. The counter counts only exceptions taken locally, including Virtual IRQ exceptions.

**0x087, EXC_FIQ, Exception taken, FIQ**

This event is similar to Exception taken, EXC_TAKEN, but the counter counts only FIQ exceptions. The counter counts only exceptions taken locally, including Virtual FIQ exceptions.

**0x088, EXC_SMC, Exception taken, Secure Monitor Call**

This event is similar to Exception taken, EXC_TAKEN, but the counter counts only Secure Monitor Call exceptions. The counter does not increment on SMC instructions trapped as a Hyp Trap exception.

**0x08A, EXC_HVC, Exception taken, Hypervisor Call**

This event is similar to Exception taken, EXC_TAKEN, but the counter counts only Hypervisor Call exceptions. The counter counts for both Hypervisor Call exceptions taken locally in the hypervisor and those taken as an exception from Non-secure EL1.

**0x08B, EXC_TRAP_PABORT, Exception taken, Instruction Abort not taken locally**

This event is similar to Exception taken, EXC_TAKEN, but the counter counts only Instruction Abort exceptions not taken locally.

**0x08C, EXC_TRAP_DABORT, Exception taken, Data Abort or SError not taken locally**

This event is similar to Exception taken, EXC_TAKEN, but the counter counts only Data Abort or SError interrupt exceptions not taken locally.

**0x08D, EXC_TRAP_OTHER, Exception taken, other traps not taken locally**

This event is similar to Exception taken, EXC_TAKEN, but the counter counts only those traps that are not counted as:

- Exception taken, Hypervisor Call.
- Exception taken, Instruction Abort not taken locally.
- Exception taken, Data Abort or SError not taken locally.
- Exception taken, IRQ not taken locally.
- Exception taken, FIQ not taken locally.

**0x08E, EXC_TRAP_IRQ, Exception taken, IRQ not taken locally**

This event is similar to Exception taken, EXC_TAKEN, but the counter counts only IRQ exceptions not taken locally.

**0x08F, EXC_TRAP_FIQ, Exception taken, FIQ not taken locally**

This event is similar to Exception taken, EXC_TAKEN, but the counter counts only FIQ exceptions not taken locally.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**0x090, RC_LD_SPEC, Release consistency operation speculatively executed, Load-Acquire**

The counter counts Load-Acquire operations that are speculatively executed. The definition of speculatively executed is IMPLEMENTATION DEFINED.

**0x091, RC_ST_SPEC, Release consistency operation speculatively executed, Store-Release**

The counter counts Store-Release operations that are speculatively executed. The definition of speculatively executed is IMPLEMENTATION DEFINED.

**0x0A0, L3D_CACHE_RD, Attributable Level 3 data or unified cache access, read**

This event is similar to Attributable Level 3 data or unified cache access, L3D_CACHE, but the counter counts only attributable memory read operations that cause a cache access to at least the Level 3 data or unified cache.

**0x0A1, L3D_CACHE_WR, Level 3 data or unified cache access, write**

This event is similar to Attributable Level 3 data or unified cache access, L3D_CACHE, but the counter counts only attributable memory write operations that cause a cache access to at least the Level 3 data or unified cache.

**0x0A2, L3D_CACHE_REFILL_RD, Level 3 data or unified cache refill, read**

This event is similar to Attributable Level 3 data or unified cache refill, L3D_CACHE_REFILL, but the counter counts only attributable memory read operations that cause a refill of at least the Level 3 data or unified cache from outside the Level 3cache. See also *Relationship between REFILL events and associated access events.* on page K3-5543

**0x0A3, L3D_CACHE_REFILL_WR, Level 3 data or unified cache refill, write**

This event is similar to Attributable Level 3 data or unified cache refill, L3D_CACHE_REFILL, but the counter counts only attributable memory write operations that cause a refill of at least the Level 3 data or unified cache from outside the Level 3cache. See also *Relationship between REFILL events and associated access events.* on page K3-5543

**0x0A6, L3D_CACHE_WB_VICTIM, Level 3 data or unified cache write-back, victim**

This event is similar to Attributable Level 3 data cache write-back, L3D_CACHE_WB, but the counter counts only write-backs that are a result of the line being allocated for an access made by the PE.

Write-backs caused by the execution of a cache maintenance instruction are not counted.

It is IMPLEMENTATION DEFINED whether a write of a whole cache line that is not the result of the eviction of a line from the cache is counted. For example, this might occur if the PE detects streaming writes to memory and does not allocate lines to the cache, or as the result of a DC ZVA.

**0x0A7, L3D_CACHE_WB_CLEAN, Attributable Level 3 data or unified cache write-back, cache clean**

This event is similar to Level 3 data cache write-back, L3D_CACHE_WB, but the counter counts only write-backs that are a result of a coherency operation made by another PE or are caused by the execution of a cache maintenance instruction. Whether write-backs that are caused by the execution of a cache maintenance instruction are counted is IMPLEMENTATION DEFINED.

**Note**

The transfer of a dirty cache line from the Level 3 data cache of this PE to the Level 3 data cache of another PE due to a hardware coherency operation is not counted unless the dirty cache line is also written back to a Level 3 cache or memory.

If a coherency request from a requestor outside the PE results in a write-back, it is an Unattributable event.

**0x0A8, L3D_CACHE_INVAL, Level 3 data or unified cache access, invalidate**

The counter counts each invalidation of a cache line in the Level 3 data or unified cache.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

The counter does not count events:

- If a cache refill invalidates a line.
- For locally-executed cache maintenance instructions that operate by set/way.

**Note**

Software that uses this event must know whether the Level 3 data cache is shared with other PEs. This event does not follow the general rule of Level 3 data cache events of only counting Attributable events.

### K3.1.1 Relationship between REFILL events and associated access events.

CACHE_REFILL and TLB_REFILL events count the refills for accesses that are counted by the corresponding CACHE or TLB event. Table K3-2 shows this correspondence.

**Table K3-2 Relationship between REFILL events and associated access events**

| REFILL event | Access event | Ratio REFILL/Access |
|---|---|---|
| 0x042 L1D_CACHE_REFILL_RD | 0x040 L1D_CACHE_RD | Level 1 cache refill rate, read |
| 0x043 L1D_CACHE_REFILL_WR | 0x041 L1D_CACHE_WR | Level 1 cache refill rate, write |
| 0x04C L1D_TLB_REFILL_RD | 0x04E L1D_TLB_RD | Level 1 TLB refill rate, read |
| 0x04D L1D_TLB_REFILL_WR | 0x04F L1D_TLB_WR | Level 1 TLB refill rate, write |
| 0x052 L2D_CACHE_REFILL_RD | 0x050 L2D_CACHE_RD | Level 2 data cache refill rate, read |
| 0x053 L2D_CACHE_REFILL_WR | 0x051 L2D_CACHE_WR | Level 2 data cache refill rate, write |
| 0x05C L2D_TLB_REFILL_RD | 0x05E L2D_TLB_RD | Level 2 data TLB refill rate, read |
| 0x05D L2D_TLB_REFILL_WR | 0x05F L2D_TLB_WR | Level 2 data TLB refill rate, write |
| 0x0A2 L3D_CACHE_REFILL_RD | 0x0A0 L3D_CACHE_RD | Level 3 data cache refill rate, read |
| 0x0A3 L3D_CACHE_REFILL_WR | 0x0A1 L3D_CACHE_WR | Level 3 data cache refill rate, write |

## K3.2 Summary of events for exceptions taken to an Exception Level using AArch64

Table K3-3 shows the events for exceptions taken to an Exception level using AArch64.

**Table K3-3 Events for exceptions taken to an Exception level using AArch64**

| ESR.EC | Description | | Event number and classification for exception taken to | |
|---|---|---|---|---|
| | | | EL1, or the current Exception level | EL2 or EL3, from below |
| 0x00 | Unknown or uncategorized | | 0x081, Other synchronous | 0x08D, Other traps not taken locally |
| 0x01 | WFE/WFI traps | | 0x081, Other synchronous | 0x08D, Other traps not taken locally |
| 0x03 | AArch32 CP15 MCR/MRC traps | | 0x081, Other synchronous | 0x08D, Other traps not taken locally |
| 0x04 | AArch32 CP15 MCRR/MRRC traps | | 0x081, Other synchronous | 0x08D, Other traps not taken locally |
| 0x05 | AArch32 CP14 MCR/MRC traps | | 0x081, Other synchronous | 0x08D, Other traps not taken locally |
| 0x06 | AArch32 CP14 LDC/STC traps | | 0x081, Other synchronous | 0x08D, Other traps not taken locally |
| 0x07 | Advanced SIMD or FP traps | | 0x081, Other synchronous | 0x08D, Other traps not taken locally |
| 0x08 | AArch32 MVFR* and FPSID traps | | - | 0x08D, Other traps not taken locally |
| 0x0C | AArch32 CP14 MCRR/MRRC traps | | 0x081, Other synchronous | 0x08D, Other traps not taken locally |
| 0x0E | Illegal instruction set state | | 0x081, Other synchronous | 0x08D, Other traps not taken locally |
| 0x11 | AArch32 SVC | | 0x082, Supervisor Call | 0x08D, Other traps not taken locally |
| 0x12 | AArch32 HVC that is not disabled | | - | 0x08A, Hypervisor Call |
| 0x13 | AArch32 SMC that is not disabled | to EL2 | - | 0x08D, Other traps not taken locally |
| | | to EL3 | - | 0x088, Secure Monitor Call |
| 0x15 | AArch64 SVC | | 0x082, Supervisor Call | 0x08D, Other traps not taken locally |
| 0x16 | AArch64 HVC that is not disabled | | 0x08A, Hypervisor Call | 0x08A, Hypervisor Call |
| 0x17 | AArch64 SMC that is not disabled | to EL2 | - | 0x08D, Other traps not taken locally |
| | | to EL3 | 0x088, Secure Monitor Call | 0x088, Secure Monitor Call |
| 0x18 | AArch64 MSR, MRS and system instruction traps | | 0x081, Other synchronous | 0x08D, Other traps not taken locally |
| 0x20 | Instruction abort from below | | 0x083, Instruction Abort | 0x08B, Instruction Abort not taken locally |
| 0x21 | Instruction abort from current Exception level | | 0x083, Instruction Abort | - |
| 0x22 | PC alignment | | 0x083, Instruction Abort | 0x08B, Instruction Abort not taken locally |
| 0x24 | Data Abort from below | | 0x084, Data Abort or SError | 0x08C, Data Abort or SError not taken locally |
| 0x25 | Data Abort from current Exception level | | 0x084, Data Abort or SError | - |
| 0x26 | Stack pointer alignment | | 0x084, Data Abort or SError | 0x08C, Data Abort or SError not taken locally |

**Table K3-3 Events for exceptions taken to an Exception level using AArch64 (continued)**

| ESR.EC | Description | Event number and classification for exception taken to | |
|---|---|---|---|
| | | EL1, or the current Exception level | EL2 or EL3, from below |
| 0x28 | AArch32 FP exception | 0x081, Other synchronous | 0x08D, Other traps not taken locally |
| 0x2C | AArch64 FP exception | 0x081, Other synchronous | 0x08D, Other traps not taken locally |
| 0x2F | SError interrupt | 0x084, Data Abort or SError | 0x08C, Data Abort or SError not taken locally |
| 0x30 | Breakpoint from below | 0x083, Instruction Abort | 0x08B, Instruction Abort not taken locally |
| 0x31 | Breakpoint from current Exception level | 0x083, Instruction Abort | - |
| 0x32 | Software step from below | 0x083, Instruction Abort | 0x08B, Instruction Abort not taken locally |
| 0x33 | Software step from current Exception level | 0x083, Instruction Abort | - |
| 0x34 | Watchpoint from below | 0x084, Data Abort or SError | 0x08C, Data Abort or SError not taken locally |
| 0x35 | Watchpoint from current Exception level | 0x084, Data Abort or SError | - |
| 0x38 | AArch32 BKPT instruction | 0x083, Instruction Abort | 0x08B, Instruction Abort not taken locally |
| 0x3A | AArch32 Vector Catch debug event | 0x083, Instruction Abort | 0x08B, Instruction Abort not taken locally |
| 0x3C | AArch64 BRK instruction | 0x083, Instruction Abort | 0x08B, Instruction Abort not taken locally |
| - | IRQ interrupt | 0x086, IRQ | 0x08E, IRQ not taken locally |
| - | FIQ interrupt | 0x087, FIQ | 0x08F, FIQ not taken locally |

**Note**

In these definitions, an exception that is *taken locally* means an exception that is taken to the default Exception level, and is not routed to another Exception level. See *Exception levels* on page D1-1514 for more information.

# Appendix K4
# Recommendations for reporting memory attributes on an interconnect

This appendix describes the ARM recommendations for reporting the memory attributes that are assigned by the PE. It contains the following section:

- *ARM recommendations for reporting memory attributes on an interconnect* on page K4-5548.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K4.1 ARM recommendations for reporting memory attributes on an interconnect

The ARM architecture defines the architectural interface between software and the PE hardware. This means the mechanisms by which different memory type and cacheability attributes are presented on an interface to an interconnect fabric such as AMBA® AXI are, strictly, outside the scope of the architecture. This appendix describes an approach for the interface between a PE implementation and an interconnect fabric that ARM strongly recommends, but these recommendations do not form part of the ARMv8 architecture.

### K4.1.1 Effect of microarchitectural choices on memory attributes

Implementations of the ARM architecture permit considerable variability in the presentation of memory attributes on the interconnect fabric, particularly in cases where the PE implementation does not provide optimized support for a memory type. For example, an implementation might treat Write-through locations as Non-cacheable at some level of cache, because functionally this is consistent with the definition of Write-through, but for the particular implementation the performance trade-off does not merit the hardware directly providing Write-through capability. However, in such implementations, the assigned memory attributes are not changed by the microarchitectural choices. The microarchitecture simply implements different ways of handling some memory attributes.

Therefore, ARM strongly recommended that where any or all of the following memory attributes are presented on the interface between a PE and an interconnect fabric, the attributes that are presented are completely consistent with the attributes defined by the translation system:

- The memory type, Normal or Device.
- The Early write acknowledgement attribute.
- The ordering requirements.
- The Shareability.
- The Cacheability, including where practicable, the allocation hints.

#### Effect when the cache is disabled

ARM also strongly recommends that the effects of the caches being disabled, as described in *Cache enabling and disabling* on page D3-1710 for AArch64 and in *Cache enabling and disabling in AArch32 state* on page G3-3955 for AArch32, are reflected on the interconnect by the memory type and attributes used for memory transactions generated while the cache is disabled.

# Appendix K5
# ARMv8 Changes to the T32 and A32 Instruction Sets

This appendix summarizes the changes that ARMv8 makes to the T32 and A32 instruction sets. It contains the following sections:

- *The A32 and T32 instruction sets* on page K5-5550.
- *Partial deprecation of IT* on page K5-5551.
- *New A32 and T32 Load-Acquire/Store-Release instructions* on page K5-5552.
- *New A32 and T32 scalar floating-point instructions* on page K5-5553.
- *New A32 and T32 Advanced SIMD floating-point instructions* on page K5-5556.
- *New A32 and T32 instructions provided by the Cryptographic Extension* on page K5-5558.
- *New A32 and T32 System instructions* on page K5-5559.
- *CRC32 instructions* on page K5-5561.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K5.1 The A32 and T32 instruction sets

This chapter describes the changes that ARMv8-A makes to the T32 and A32 instruction sets, compared to an ARMv7-A implementation that includes all of the following extensions:

- Multiprocessing Extensions.
- Large Physical Address Extension.
- Virtualization Extensions.
- Security Extensions.
- VFPv4.
- Advanced SIMDv2.

These ARMv8 changes are not affected by whether the ARMv8-A implementation includes either or both of EL2 and EL3.

ARMv8-A obsoletes the A32 `SWP` and `SWPB` instructions.

ARM deprecates any use of the following instructions. The first two of these deprecations are made for performance reasons. In ARMv8-A, privileged software can disable this functionality, see the descriptions of the SCTLR.{CP15BEN, ITD, SED} and HSCTLR.{CP15BEN, ITD, SED} bits:

- The A32 and T32 CP15 memory barriers CP15DSB, CP15ISB, and CP15DMB.
- A subset of T32 `IT` instruction functionality, as described in *Partial deprecation of IT* on page K5-5551.
- The A32 and T32 `SETEND` instruction.

ARMv8-A adds new A32 and T32 instructions to align with some of the features introduced in the A64 instruction set. These are described in:

- *Partial deprecation of IT* on page K5-5551.
- *New A32 and T32 Load-Acquire/Store-Release instructions* on page K5-5552.
- *New A32 and T32 scalar floating-point instructions* on page K5-5553.
- *New A32 and T32 Advanced SIMD floating-point instructions* on page K5-5556.
- *New A32 and T32 instructions provided by the Cryptographic Extension* on page K5-5558.
- *New A32 and T32 System instructions* on page K5-5559.

**Note**

The existing A32 and T32 assembler syntax is unchanged from ARMv7 UAL. Where the syntax term <c> is used in this chapter, it represents a standard ARM condition code. Mnemonics that do not include <c> can not be conditionally executed.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K5.2 Partial deprecation of IT

ARMv8-A deprecates some uses of the T32 IT instruction, for performance reasons. All uses of IT that apply to instructions other than a single subsequent 16-bit instruction from a restricted set are deprecated, as are explicit references to the PC within that single 16-bit instruction. This permits the non-deprecated forms of IT and subsequent instructions to be treated as a single 32-bit conditional instruction. Table K5-1 shows the restricted set of 16-bit instructions that are not deprecated when used in conjunction with IT.

**Table K5-1 Non-deprecated IT 16-bit conditional instructions**

| Permitted 16-bit instructions | Class | Notes |
|---|---|---|
| MOV, MVN | Move | Deprecated when Rm or Rd is the PC. |
| LDR, LDRB, LDRH, LDRSB, LDRSH | Load | Deprecated for PC-relative load literal forms |
| STR, STRB, STRH | Store | - |
| ADD, ADC, RSB, SBC, SUB | Add/Subtract | Deprecated for ADD SP,SP,#imm, SUB SP,SP,#imm, and when Rm, Rdn, or Rdm is the PC |
| CMP, CMN | Compare | Deprecated when Rm or Rn is the PC |
| MUL | Multiply | - |
| ASR, LSL, LSR, ROR | Shift | - |
| AND, BIC, EOR, ORR, TST | Logical | - |
| BX, BLX | Branch to register | Deprecated when Rm is the PC |

The full ARMv7 IT instruction functionality remains available in order to execute legacy T32 code. It is IMPLEMENTATION DEFINED whether an ARMv8 implementation provides an ITD control, that software can use to disable the deprecated uses of the IT instruction. In an implementation that included the ITD control, setting an ITD field to 1 disables the deprecated uses of the IT instruction, making those uses of the IT instruction UNDEFINED. The ITD control fields are:

**HSCTLR.ITD** When EL2 is using AArch32, makes execution of the deprecated uses of the IT UNDEFINED at EL2.

**SCTLR.ITD** When EL1 is using AArch32, makes execution of the deprecated uses of the IT UNDEFINED at EL0 and EL1.

**SCTLR_EL1.ITD**

When EL1 is using AArch64, makes execution of the deprecated uses of the IT UNDEFINED at EL0 when EL0 is using AArch32.

## K5.3 New A32 and T32 Load-Acquire/Store-Release instructions

The new Load-Acquire/Store-Release instructions must be naturally aligned. LDAEXD and STLEXD must be aligned to 8 bytes. An unaligned address causes an alignment fault. For more information about the ordering of Load-Acquire/Store-Release, see *Load-Acquire, Store-Release* on page E2-2378.

### K5.3.1 A32 and T32 Load-Acquire/Store-Release (non-exclusive) instructions

Table K5-2 shows the new A32 and T32 Load-Acquire/Store-Release (non-exclusive) instructions.

**Table K5-2 A32 and T32 Load-Acquire/Store-Release (non-exclusive) instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| LDA | Load-Acquire Word | *LDA* on page F6-2692 |
| LDAB | Load-Acquire Byte | *LDAB* on page F6-2693 |
| LDAH | Load-Acquire Halfword | *LDAH* on page F6-2702 |
| STL | Store-Release Word | *STL* on page F6-3030 |
| STLB | Store-Release Byte | *STLB* on page F6-3031 |
| STLH | Store-Release Halfword | *STLH* on page F6-3040 |

### K5.3.2 A32 and T32 Load-Acquire/Store-Release Exclusive instructions

Table K5-3 shows the new A32 and T32 Load-Acquire/Store-Release Exclusive instructions.

**Table K5-3 A32 and T32Load-Acquire/Store-Release Exclusive instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| LDAEX | Load-Acquire Exclusive Word | *LDAEX* on page F6-2694 |
| LDAEXB | Load-Acquire Exclusive Byte | *LDAEXB* on page F6-2696 |
| LDAEXD | Load-Acquire Exclusive Double | *LDAEXD* on page F6-2698 |
| LDAEXH | Load-Acquire Exclusive Halfword | *LDAEXH* on page F6-2700 |
| STLEX | Store-Release Exclusive Word | *STLEX* on page F6-3032 |
| STLEXB | Store-Release Exclusive Byte | *STLEXB* on page F6-3034 |
| STLEXD | Store-Release Exclusive Double | *STLEXD* on page F6-3036 |
| STLEXH | Store-Release Exclusive Halfword | *STLEXH* on page F6-3038 |

*Non-Confidential - Beta*

## K5.4 New A32 and T32 scalar floating-point instructions

This section describes the new A32 and T32 scalar floating-point instructions. It contains the following subsections:

- *A32 and T32 floating-point conditional select*.
- *A32 and T32 floating-point minimum and maximum numeric*.
- *A32 and T32 floating-point to integer conversion*.
- *A32 and T32 floating-point conversion between half-precision and double-precision* on page K5-5554.
- *A32 and T32 floating-point round to integer* on page K5-5554.

### K5.4.1 A32 and T32 floating-point conditional select

The new `VSEL` instruction conditionally copies one of its two source registers to the destination register. For A32 it provides an alternative to a pair of conditional `VMOV` instructions, while for T32 it compensates for the partial deprecation of `IT` instruction described in *Partial deprecation of IT* on page K5-5551, since it does not require an `IT` prefix.

Table K5-4 shows the A32 and T32 floating-point conditional select instructions

**Table K5-4 A32 and T32 Conditional select**

| Mnemonic | Instruction | See |
|---|---|---|
| `VSEL` | Conditional select | *VSELEQ, VSELGE, VSELGT, VSELVS* on page F7-3661 |

### K5.4.2 A32 and T32 floating-point minimum and maximum numeric

The new `VMAXNM` and `VMINNM` instructions implement the `minNum(x,y)` and `maxNum(x,y)` operations defined by the IEEE754-2008 standard. They return the numerical operand when one operand is numerical and the other is a quiet NaN, but otherwise the result is identical to `VFP VMAX` and `VMIN`. These instructions cannot be conditionally executed.

Table K5-5 shows the A32 and T32 floating-point minNum and maxNum instructions.

**Table K5-5 A32 and T32 floating-point minNum and maxNum instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| `VMAXNM` | Single-precision maxNum (scalar) | *VMAXNM* on page F7-3440 |
| `VMINNM` | Double-precision minNum (scalar) | *VMINNM* on page F7-3447 |

### K5.4.3 A32 and T32 floating-point to integer conversion

These new instructions extend the ARMv7 VFP `VCVT` instructions by providing four additional explicit rounding modes. The instruction syntax is `VCVT`*r*, where *r* selects the rounding mode as follows:

`N` Round to Nearest.

`A` Round to Nearest with Ties to Away.

`P` Round towards Plus Infinity.

`M` Round towards Minus Infinity.

The rounding modes are defined by the IEEE 754 standards, see *Floating-point standards, and terminology* on page A1-48.

These instructions cannot be conditionally executed.

Non-Confidential - Beta

Table K5-6 shows the A32 and T32 FP to integer conversion instructions.

**Table K5-6 A32 and T32 floating-point to integer conversion instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| VCVTA | Convert floating-point to integer with Round to Nearest with Ties to Away | *VCVTA (floating-point)* on page F7-3345 |
| VCVTM | Convert floating-point to integer with Round towards Minus Infinity | *VCVTM (floating-point)* on page F7-3352 |
| VCVTN | Convert floating-point to integer with Round to Nearest | *VCVTN (floating-point)* on page F7-3356 |
| VCVTP | Convert floating-point to integer with Round towards Plus Infinity | *VCVTP (floating-point)* on page F7-3360 |

### K5.4.4 A32 and T32 floating-point conversion between half-precision and double-precision

The VFP VCVTT and VCVTB instructions are extended to permit direct conversion between half-precision and double-precision floating-point as a single operation, preventing double rounding errors. The syntax term <y> in Table K5-7 is either T, top half, and B, bottom half.

Table K5-7 shows the A32 and T32 instructions to convert between half-precision and double-precision floating-point values.

**Table K5-7 A32 and T32 floating-point precision conversion**

| Mnemonic | Instruction | See |
|---|---|---|
| VCVTB | Floating-point convert half-precision to double-precision | *VCVTB* on page F7-3347 |
| VCVTT | Floating-point convert double-precision to half-precision | *VCVTT* on page F7-3365 |

### K5.4.5 A32 and T32 floating-point round to integer

The new round to integer instructions round a floating-point value to the nearest integer floating-point value of the same size. The floating-point exceptions that can be raised by these instructions are the Invalid operation, for a signaling NaN input, or Input Denormal, for a denormal input when flush-to-zero mode is enabled. For VRINTX only an Inexact exception can be raised if the result is numeric and does not have the same numerical value as the source. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal floating-point arithmetic.

The instruction syntax is VRINT*r*, where *r* selects the rounding mode as follows:

- N Round to Nearest.
- A Round to Nearest with Ties to Away.
- P Round towards Plus Infinity.
- M Round towards Minus Infinity.
- Z Round towards Zero.
- R FPSCR rounding mode.
- X FPSCR rounding mode, signaling inexactness.

When *r* is R, X, or Z, the round to integer instruction can be conditionally executed. The remaining round to integer instructions must be unconditional.

Table K5-8 on page K5-5555 shows the A32 and T32 round to integer instructions.

## K5.5 New A32 and T32 Advanced SIMD floating-point instructions

The AArch32 Advanced SIMD instructions support only single-precision, 32-bit, floating-point data types, with fixed operating modes of Round to Nearest, Default NaN, and Flush-to-Zero. However, they are extended by the addition of the instructions described in the following subsections:

- *A32 and T32 floating-point minimum and maximum numeric*.
- *A32 and T32 floating-point conversion*.
- *A32 and T32 floating-point round to integral*.

### K5.5.1 A32 and T32 floating-point minimum and maximum numeric

Vector forms of the new `VMAXNM` and `VMINNM` instructions are described in *A32 and T32 floating-point minimum and maximum numeric* on page K5-5553.

Table K5-9 shows the A32 and T32 floating-point minNum/maxNum instructions.

**Table K5-9 A32 and T32 floating-point minNum/maxNum instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| `VMAXNM` | Single-precision maxNum (vector) | *VMAXNM* on page F7-3440 |
| `VMINNM` | Double-precision minNum (vector) | *VMINNM* on page F7-3447 |

### K5.5.2 A32 and T32 floating-point conversion

Vector forms of the floating-point to integer conversion instructions are described in *A32 and T32 floating-point to integer conversion* on page K5-5553. The instruction syntax is `VCVT`*r*, where *r* selects the rounding mode as follows:

`N` Round to Nearest.

`A` Round to Nearest with Ties to Away.

`P` Round towards Plus Infinity.

`M` Round towards Minus Infinity.

The rounding modes are defined by the IEEE 754 standards, see *Floating-point standards, and terminology* on page A1-48.

Table K5-10 shows the A32 and T32 floating-point conversion instructions.

**Table K5-10 A32 and T32 floating-point conversion instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| `VCVTA` | Vector Convert floating-point to integer with Round to Nearest with Ties to Away | *VCVTA (Advanced SIMD)* on page F7-3343 |
| `VCVTM` | Vector Convert floating-point to integer with Round towards Minus Infinity | *VCVTM (Advanced SIMD)* on page F7-3350 |
| `VCVTN` | Vector Convert floating-point to integer with Round to Nearest | *VCVTN (Advanced SIMD)* on page F7-3354 |
| `VCVTP` | Vector Convert floating-point to integer with Round towards Plus Infinity | *VCVTP (Advanced SIMD)* on page F7-3358 |

### K5.5.3 A32 and T32 floating-point round to integral

Vector forms of the floating-point rounding instructions are described in *A32 and T32 floating-point round to integer* on page K5-5554. The instruction syntax is `VRINT`*r*, where *r* selects the rounding mode as follows:

`N` Round to Nearest.

`A` Round Nearest with Ties to Away.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`P` Round towards Plus Infinity.

`M` Round towards Minus Infinity.

`Z` Round towards Zero.

`X` Round to Nearest, signaling inexactness.

The rounding modes are defined by the IEEE 754 standards, see *Floating-point standards, and terminology* on page A1-48.

Table K5-11 shows the A32 and T32 floating-point round to integral instructions.

**Table K5-11 A32 and T32 SIMD floating-point round to integral instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| `VRINTA` | Vector Round floating-point to integer towards Nearest with Ties to Away | *VRINTA (Advanced SIMD)* on page F7-3617 |
| `VRINTM` | Vector Round floating-point to integer towards Minus Infinity | *VRINTM (Advanced SIMD)* on page F7-3621 |
| `VRINTN` | Vector Round floating-point to integer to Nearest | *VRINTN (Advanced SIMD)* on page F7-3625 |
| `VRINTP` | Vector Round floating-point to integer towards Plus Infinity | *VRINTP (Advanced SIMD)* on page F7-3629 |
| `VRINTX` | Vector round floating-point to integer to nearest signalling inexactness | *VRINTX (Advanced SIMD)* on page F7-3635 |
| `VRINTZ` | Vector round floating-point to integer towards Zero | *VRINTZ (Advanced SIMD)* on page F7-3639 |

## K5.6 New A32 and T32 instructions provided by the Cryptographic Extension

The optional Cryptographic Extension instructions use the SIMD and floating-point register file. For more information see:

- Announcing the Advanced Encryption Standard.
- *The Galois/Counter Mode of Operation*.
- *Announcing the Secure Hash Standard*.

Table K5-12 shows the A32 and T32 Cryptographic Extension instructions.

**Table K5-12 A32 and T32 Cryptographic Extension instructions**

| Mnemonic | Instruction | See |
|---|---|---|
| AESD | AES single round decryption | *AESD* on page F7-3209 |
| AESE | AED single round encryption | *AESE* on page F7-3211 |
| AESIMC | AES inverse mix columns | *AESIMC* on page F7-3213 |
| AESMC | AES mix columns | *AESMC* on page F7-3214 |
| SHA1C | SHA1 hash update accelerator, choose | *SHA1C* on page F7-3224 |
| SHA1M | SHA1 hash update accelerator, majority | *SHA1M* on page F7-3227 |
| SHA1P | SHA1 hash update accelerator, parity | *SHA1P* on page F7-3229 |
| SHA1H | SHA1 hash update accelerator, rotate left by 30 | *SHA1H* on page F7-3226 |
| SHA1SU0 | SHA1 schedule update accelerator, first part | *SHA1SU0* on page F7-3231 |
| SHA1SU1 | SHA1 schedule update accelerator, second part | *SHA1SU1* on page F7-3233 |
| SHA256H | SHA256 hash update accelerator | *SHA256H* on page F7-3235 |
| SHA256H2 | SHA256 hash update accelerator upper part | *SHA256H2* on page F7-3236 |
| SHA256SU0 | SHA256 schedule update accelerator, first part | *SHA256SU0* on page F7-3237 |
| SHA256SU1 | SHA256 schedule update accelerator, second part | *SHA256SU1* on page F7-3239 |
| VMULL | Polynomial multiply long, 64×64 to 128-bit | *VMULL (integer and polynomial)* on page F7-3508 |

## K5.7 New A32 and T32 System instructions

The section describes the new System instructions. It contains the following subsections:

- *External Debug*.
- *Barriers and hints*.
- *TLB Maintenance*.

### K5.7.1 External Debug

Table K5-13 shows the new External Debug support instructions.

**Table K5-13 External Debug support instructions**

| Mnemonic | Instructions | Notes |
|---|---|---|
| DCPS1 | Debug switch to EL1, valid in Debug state only | - |
| DCPS2 | Debug switch to EL2, valid in Debug state only | - |
| DCPS3 | Debug switch to EL3, valid in Debug state only | - |
| HLT #uimm6 | Halting mode software breakpoint | Enters Debug state if allowed, with a 6-bit payload in uimm6, otherwise treated as UNDEFINED |

### K5.7.2 Barriers and hints

There are new A32 and T32 barrier options and hint instructions.

Table K5-14 shows the new A32 and T32 barrier instructions.

**Table K5-14 Additional barrier instructions**

| Mnemonic | Notes |
|---|---|
| DMB {ISHLD, OSHLD, NSHLD, LD} | Data Memory Barrier is extended to support the new Load-Load/Store options |
| DSB {ISHLD, OSHLD, NSHLD, LD} | Data Synchronization Barrier is extended to support the new Load-Load/Store options |
| SEVL | Send Event Locally without the requirement to affect other processors, for example to prime a wait-loop that starts with a WFE instructions |

### K5.7.3 TLB Maintenance

TLB maintenance instructions that are only required to apply to the last level translation table walk of the first stage of translation are added to A32 and T32 as shown in Table K5-15. For more information see *Translation Lookaside Buffers (TLBs)* on page G4-4058 and *TLB maintenance requirements* on page G4-4061.

**Table K5-15 Additional A32 and T32 TLB maintenance instructions**

| Mnemonic | Relation to existing A32/T32 operation |
|---|---|
| TLBIMVALIS | Related to the TLBIMVAIS operation |
| TLBIMVAALIS | Related to the TLBIMVAAIS operation |
| TLBIMVALHIS | Related to the TLBIMVAHIS operation |
| TLBIMVAL | Related to the TLBIMVA operation |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table K5-15 Additional A32 and T32 TLB maintenance instructions (continued)**

| Mnemonic | Relation to existing A32/T32 operation |
|---|---|
| TLBIMVAAL | Related to the TLBIMVAA operation |
| TLBIMVALH | Related to the TLBIMVAH operation |

A32 and T32 include TLB maintenance instructions that must apply to individual entries from stage 2 TLB structures, that hold IPA to PA translations. These are consistent with the A64 TLBI system instructions described in *New A32 and T32 System instructions* on page K5-5559. The relation between the A32 and T32 instructions and the A64 instructions is shown in Table K5-16.

**Table K5-16 Relation of A32 TLB maintenance instructions to A64 instructions**

| T32 and A32 instruction | Relation to A64 instruction |
|---|---|
| TLBIIPAS2IS | Equivalent to IPAS2E1IS |
| TLBIIPAS2LIS | Equivalent to IPAS2LE1IS<br>Related to existing A32/T32 TLBIIPAS2IS operation |
| TLBIIPAS2 | Equivalent to the A64 IPAS2E1 operation |
| TLBIIPAS2L | Equivalent to IPAS2LE1 operation<br>Related to existing A32/T32 TLBIIPAS2 operation |

**Note**

These new system operations are accessed using the MCR instruction or, if implemented, by an assembler using the SYS mnemonic followed by the TLBI operation name.

## K5.8 CRC32 instructions

ARMv8 introduces CRC32 instructions to the T32 and A32 instruction sets. Table K5-17 shows these instructions:

**Table K5-17 CRC32 instructions**

| Mnemonic | Instructions | See |
|---|---|---|
| `CRC32` | CRC32 using polynomial `0x04C11DB7` | *CRC32* on page F6-2665 |
| `CRC32C` | CRC32 using polynomial `0x1EDC6F41` | *CRC32C* on page F6-2667 |

# Appendix K6
# Legacy Instruction Syntax for AArch32 Instruction Sets

This appendix describes the legacy instruction syntax in the ARM instruction sets, and their *Unified Assembler Language* (UAL) equivalents. It contains the following section:

- *Legacy Instruction Syntax* on page K6-5564.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K6.1 Legacy Instruction Syntax

Early versions of the ARM Architecture defined an assembly language for A32 (ARM) instructions, and a separate assembly language for T32 (Thumb) instructions. UAL is based on the A32 assembly language, with some changes to the instruction syntax. The appendix describes those changes. The pre-UAL mnemonics are compatible with UAL, and might be supported by an assembler.

The original T32 assembly language is not compatible with UAL, and is not described in the manual.

### K6.1.1 Pre-UAL instruction syntax for the A32 base instructions

Table K6-1 lists the syntax for the A32 base instructions that have changed after UAL was introduced.

**Table K6-1 Pre-UAL instruction syntax for the A32 base instructions**

| Pre-UAL syntax | UAL equivalent | See |
|---|---|---|

### K6.1.3 FCONST

The syntax of FCONST is

```
FCONST<dest>{<c>} <Fd>, #<imm8>
```

where:

<dest> Specifies the destination data type. It must be one of:

- S . Single-precision floating-point.
- D . Double-precision floating-point.

<c> This is an optional field. It specifies the condition under which the instruction is executed. See *Conditional execution* on page F2-2447 for the range of available conditions and their encoding. If <c> is omitted, it defaults to *always* (AL).

<Fd> Specifies the destination register. It must be one of:

- <Dd> 64-bit name of the SIMD&FP destination register.
- <Sd> 32-bit name of the SMID&FP destination register.

<imm8> Specifies the immediate value used to generate the floating-point constant.

`FCONSTD{<c>} <Dd>, #<imm8>` maps to `VMOV.F64 <Dd>, #<fpimm>`

`FCONSTS{<c>} <Sd>, #<imm8>` maps to `VMOV.F32 <Sd>, #<fpimm>`

# Appendix K7
# Address translation examples

This appendix gives examples of address translations using the translation regimes described in Chapter D4 *The AArch64 Virtual Memory System Architecture* and Chapter G4 *The AArch32 Virtual Memory System Architecture*. It contains the following sections:

- *AArch64 Address translation examples* on page K7-5572.
- *AArch32 Address translation examples* on page K7-5585.

**Note**

This chapter gives examples of translation table lookups for the ARMv8 address translation stages. It does not define any part of the address translation mechanism. If any information in this appendix appears to contradict the information in Chapter D4 *The AArch64 Virtual Memory System Architecture* or Chapter G4 *The AArch32 Virtual Memory System Architecture* then the information in Chapter D4 or Chapter G4 must be taken as the definition of the required behavior.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K7.1 AArch64 Address translation examples

Figure D4-2 on page D4-1746 shows the VMSAv8 address translation stages that are controlled by an Exception level that is using AArch64. *The VMSAv8-64 address translation system* on page D4-1745 describes the VMSAv8-64 address translation scheme. This section gives examples of the use of that scheme, for common translation requirements.

*System registers relevant to MMU operation* on page D4-1750 specifies the relevant registers, including the TCR and TTBR, or TTBRs, for each stage of address translation.

For any stage of translation, a TCR.T*n*SZ field indicates the supported input address size. For a stage of address translation controlled from an Exception level using AArch64, the supported input address size is $2^{(64-T\mathit{n}SZ)}$.

This section describes:

- Performing the initial lookup, for an address for which the initial lookup is either:
  - At the highest lookup level used for the appropriate translation granule size.
  - Because of the concatenation of translation tables at the initial lookup level, one level down from the highest level used for the translation granule size.

  These descriptions take account of the following cases:
  - The IA size is smaller than the largest size for the translation level, see *Reduced IA width* on page D4-1758.
  - For a stage 2 translation, translation tables are concatenated, to move the initial lookup level down by one level, see *Concatenated translation tables* on page D4-1759.

  For examples of performing the initial lookup, see *Examples of performing the initial lookup*.
- The full translation flow for resolving a page of memory. These examples describe resolving the largest IA size supported by the initial lookup level. For these examples, see *Full translation flows for VMSAv8-64 address translation* on page K7-5579.

### K7.1.1 Examples of performing the initial lookup

The address ranges used for the initial translation table lookup depend on the translation granule, as described in:

- *Performing the initial lookup using the 4KB translation granule*.
- *Performing the initial lookup using the 16KB granule* on page K7-5575.
- *Performing the initial lookup using the 64KB translation granule* on page K7-5577.

#### Performing the initial lookup using the 4KB translation granule

This subsection describes examples of the initial lookup when using the 4KB translation granule that Table D4-12 on page D4-1764 shows as starting at level 0 or at level 1. It includes those stage 2 translations where concatenation of translation tables is required for the lookup to start at level 1. This means that it gives specific examples of the mechanisms described in *The VMSAv8-64 address translation system* on page D4-1745.

**Note**

For stage 2 translations, the same principles apply to an initial lookup that Table D4-12 on page D4-1764 shows as starting at level 1. In this case, for some IA sizes concatenation of translation tables means the lookup can, instead, start at level 2.

The following subsections describe these examples of the initial lookup:

- *Initial lookup at level 0, 4KB translation granule* on page K7-5573.
- *Initial lookup at level 1, 4KB translation granule* on page K7-5573.

In all cases, for a stage 2 translation, the VTCR_EL2.SL0 field must indicate the required initial lookup level, and this level must be consistent with the value of the VTCR_EL2.T0SZ field, see *Overview of stage 2 translations, 4KB granule* on page D4-1763.

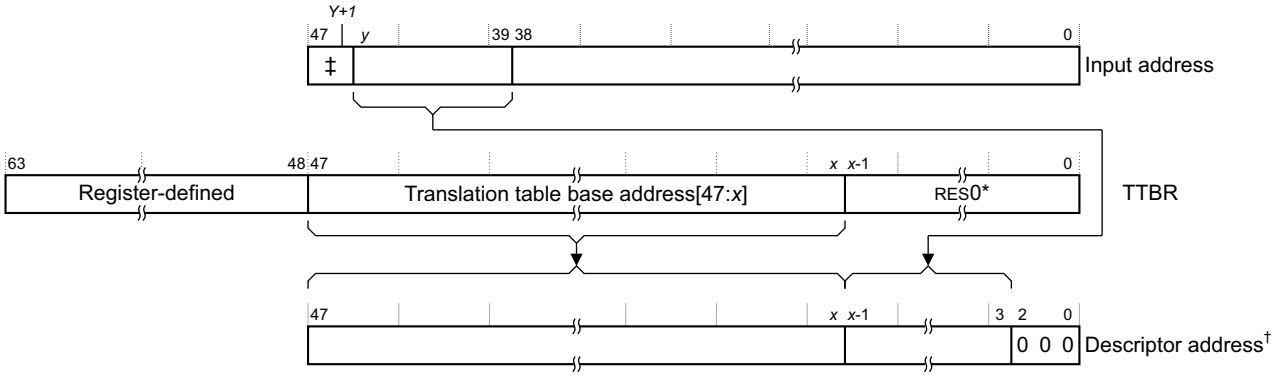
Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### *Initial lookup at level 0, 4KB translation granule*

This subsection describes initial lookups with an input address width of ($n$+1) bits, meaning the input address is IA[$n$:0]. As Table D4-12 on page D4-1764 shows, a stage 1 or stage 2 initial lookup at level 0 is required when $39 \le n \le 47$. For these lookups:

- TTBR[47:($n$-35)] specify the translation table base address.
- Bits[$n$:39] of the input address are bits[($n$-36):3] of the descriptor offset in the translation table.

**Note**



**This means that, when the input address width is less than 48 bits**

- The size of the translation table is reduced.
- More low-order bits of the TTBR are required to specify the translation table base address.
- Fewer input address bit are used to specify the descriptor offset in the translation table.

For example, if the input address width is 46 bits:

- The translation table size is 1KB,
- TTBR bits[47:10] specify the translation table base address.
- Input address bits[45:39] specify bits[9:3] of the descriptor offset.

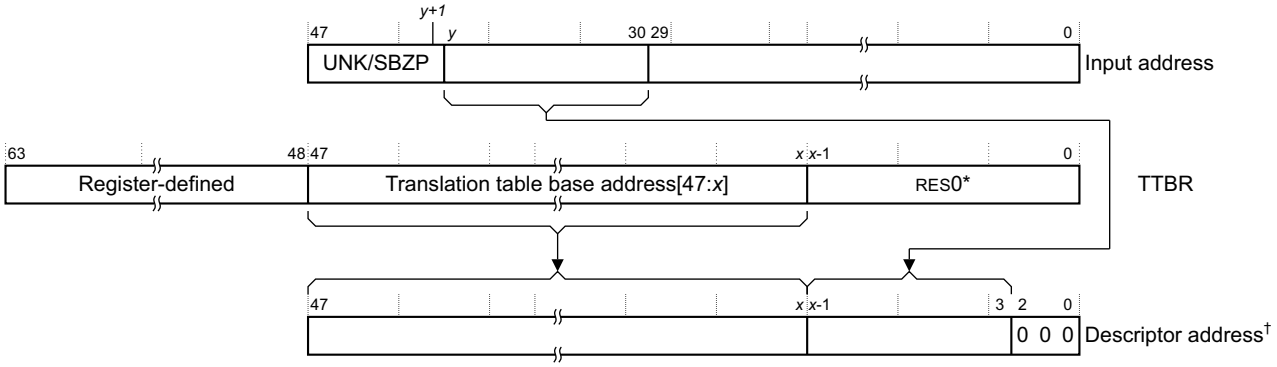
Figure K7-1 shows this lookup.

Supported input address range is IA[$y$:0], $4 \le x \le 12$, $y = x + 35$. When $y$ is 47 the field marked ‡ is absent.
† For a Non-secure EL1&0 stage 1 translation, the IPA of the descriptor. Otherwise, the PA of the descriptor.
* Field has additional properties to the default RES0 definition, see the register description for more information.

**Figure K7-1 Initial lookup for VMSAv8-64 using the 4KB granule, starting at level 0**

### *Initial lookup at level 1, 4KB translation granule*

This subsection describes initial lookups with an input address width of ($n$+1) bits, meaning the input address is IA[$n$:0].



**For a stage 1 or stage 2 initial lookup at level 1, without use of concatenated translation tables**

As Table D4-12 on page D4-1764 shows, this applies to IA[$n$:0], where $30 \le n \le 38$. For these lookups:

- There is a single translation table at this level.
- TTBR[47:($n$-26)] specify the translation table base address.
- Bits[$n$:30] of the input address are bits[($n$-27):3] of the descriptor offset in the translation table.

Figure K7-2 on page K7-5574 shows this lookup.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Supported input address range is IA[*y*:0], 4 ≤ *x* ≤ 12, *y* = *x* + 26.

† For a Non-secure EL1&0 stage 1 translation, the IPA of the descriptor. Otherwise, the PA of the descriptor.

* Field has additional properties to the default RES0 definition, see the register description for more information.

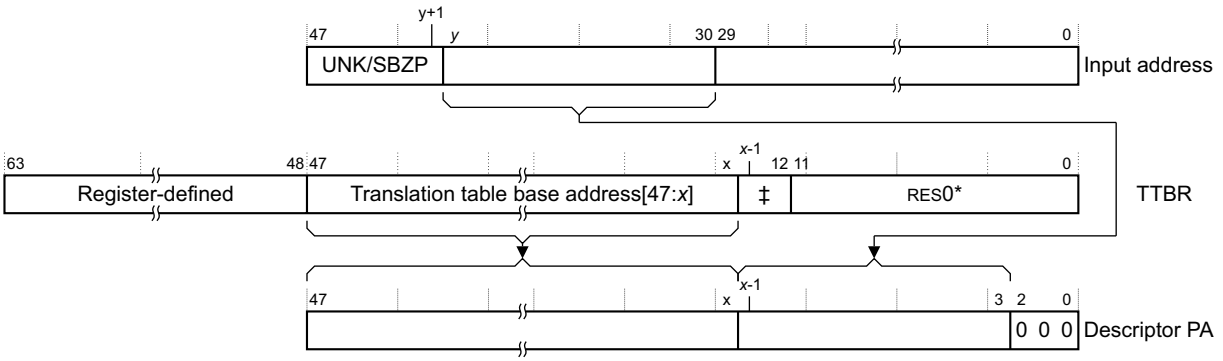


**Figure K7-2 Initial lookup for VMSAv8-64 using the 4KB granule, starting at level 1, without concatenation**

**For a stage 2 initial lookup at level 1, with concatenated translation tables**

As Table D4-12 on page D4-1764 shows, this applies to IA[*n*:0], where 39 ≤ *n* ≤ 42. For these lookups:

- There are $2^{(n-38)}$ concatenated translation tables at this level.
- These concatenated translation tables must be aligned to $2^{(n-38)}$×4KB. This means TTBR[(*n*-27):12] must be zero.
- TTBR[47:(*n*-26)] specify the base address of the block of concatenated translation tables.
- Bits[*n*:30] of the input address are bits[(*n*-27):3] of the descriptor offset from the base address of the block of concatenated translation tables.

Figure K7-3 shows this lookup.

Supported input address range is IPA[*y*:0], 4 ≤ *x* ≤ 16, *y* = *x* + 26. The field marked ‡ must be zero.

* Field has additional properties to the default RES0 definition, see the register description for more information.

**Figure K7-3 Initial lookup for VMSAv8-64 using the 4KB granule, starting at level 1, with concatenation**

*Non-Confidential - Beta*

## Performing the initial lookup using the 16KB granule

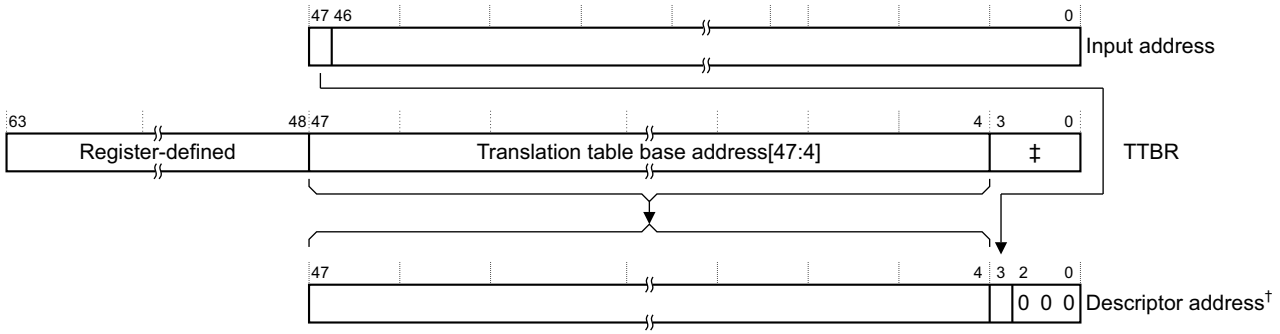
This subsection describes examples of the initial lookup when using the 16KB translation granule that Table D4-15 on page D4-1767 shows as starting at level 0 or at level 1. It includes those stage 2 translations where concatenation of translation tables is required for the lookup to start at level 1. This means that it gives specific examples of the mechanisms described in *The VMSAv8-64 address translation system* on page D4-1745.

**Note**

For stage 2 translations, the same principles apply to an initial lookup that Table D4-15 on page D4-1767 shows as starting at level 1. In this case, for some IA sizes concatenation of translation tables means the lookup can, instead, start at level 2.

The following subsections describe these examples of the initial lookup:

- *Initial lookup at level 0, 16KB translation granule*.
- *Initial lookup at level 1, 16KB translation granule* on page K7-5576.



In all cases, for a stage 2 translation, the VTCR_EL2.SL0 field must indicate the required initial lookup level, and this level must be consistent with the value of the VTCR_EL2.T0SZ field, see *Overview of stage 2 translations, 16KB granule* on page D4-1767.

### *Initial lookup at level 0, 16KB translation granule*

This subsection describes initial lookups with an input address width of ($n$+1) bits, meaning the input address is IA[$n$:0]. As Table D4-14 on page D4-1766 shows, the only case where an address translation using the 16KB granule starts at level 0 is a stage 1 translation of a 48-bit input address, IA[47:0]. For this lookup:

- The required translation table has only two entries, meaning its size is 16bytes, and it must be aligned to 16 bytes.
- TTBR[47:4] specify the translation table base address.
- Bit[47] of the input address is bits[3] of the descriptor offset in the translation table.

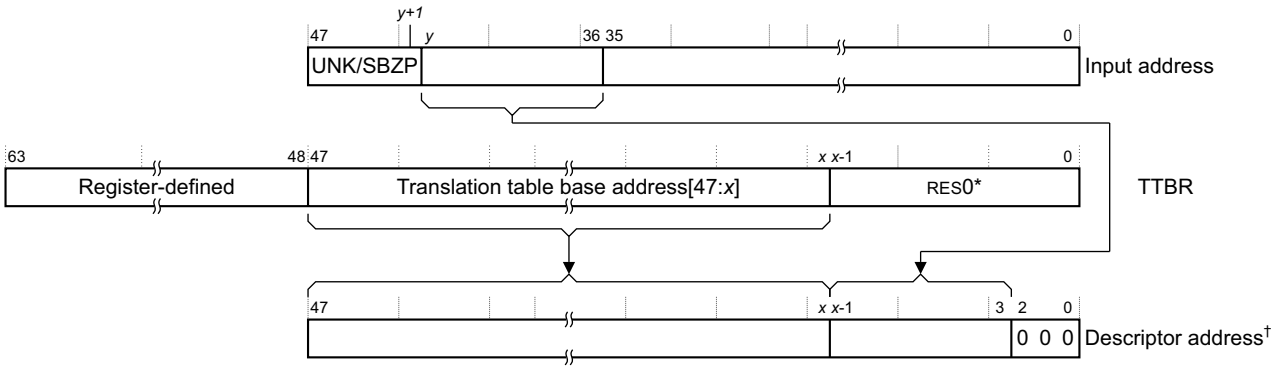
Figure K7-4 shows this lookup.

Supported input address range is IA[47:0]. The field marked ‡ is RES0*.
† For a Non-secure EL1&0 stage 1 translation, the IPA of the descriptor. Otherwise, the PA of the descriptor.
* Field has additional properties to the default RES0 definition, see the register description for more information.

**Figure K7-4 Initial lookup for VMSAv8-64 using the 16KB granule, starting at level 0**

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### *Initial lookup at level 1, 16KB translation granule*



This subsection describes initial lookups with an input address width of ($n$+1) bits, meaning the input address is IA[$n$:0].

**For a stage 1 or stage 2 initial lookup at level 1, without use of concatenated translation tables**

As Table D4-15 on page D4-1767 shows, this applies to IA[$n$:0], where $36 \le n \le 46$. For these lookups:

- There is a single translation table at this level.
- TTBR[47:($n$-32)] specify the translation table base address.
- Bits[$n$:36] of the input address are bits[($n$-33):3] of the descriptor offset in the translation table.

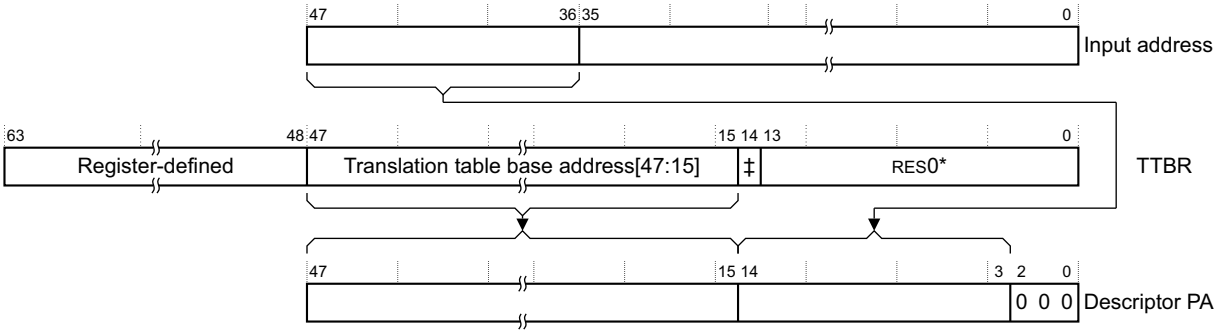
Figure K7-5 shows this lookup.

Supported input address range is IA[$y$:0], $4 \le x \le 14$, $y = x + 32$.

† For a Non-secure EL1&0 stage 1 translation, the IPA of the descriptor. Otherwise, the PA of the descriptor.

* Field has additional properties to the default RES0 definition, see the register description for more information.

**Figure K7-5 Initial lookup for VMSAv8-64 using the 16KB granule, starting at level 1, without concatenation**



**For a stage 2 initial lookup at level 1, with concatenated translation tables**

As Table D4-15 on page D4-1767 shows, the only case where an address translation using the 16KB granule starts at level 1 because of concatenation of translation tables is a stage 2 translation of a 48-bit input address, IA[47:0]. For this lookup:

- There are two concatenated translation tables at this level.
- These concatenated translation tables must be aligned to 2×16KB. This means TTBR[14] must be zero.
- TTBR[47:15] specify the base address of the block of two concatenated translation tables.
- Bits[47:36] of the input address are bits[14:3] of the descriptor offset from the base address of the block of concatenated translation tables.

Figure K7-6 on page K7-5577 shows this lookup.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

Supported input address range is IPA[47:0]. The bit marked ‡ must be zero.
* Field has additional properties to the default RES0 definition, see the register description for more information.

**Figure K7-6 Initial lookup for VMSAv8-64 using the 16KB granule, starting at level 1, with concatenation**

## Performing the initial lookup using the 64KB translation granule

This subsection describes examples of the initial lookup when using the 64KB translation granule that Table D4-18 on page D4-1770 shows as starting at level 1 or at level 2. It includes those stage 2 translations where concatenation of translation tables is required for the lookup to start at level 2. This means that it gives specific examples of the mechanisms described in *The VMSAv8-64 address translation system* on page D4-1745.

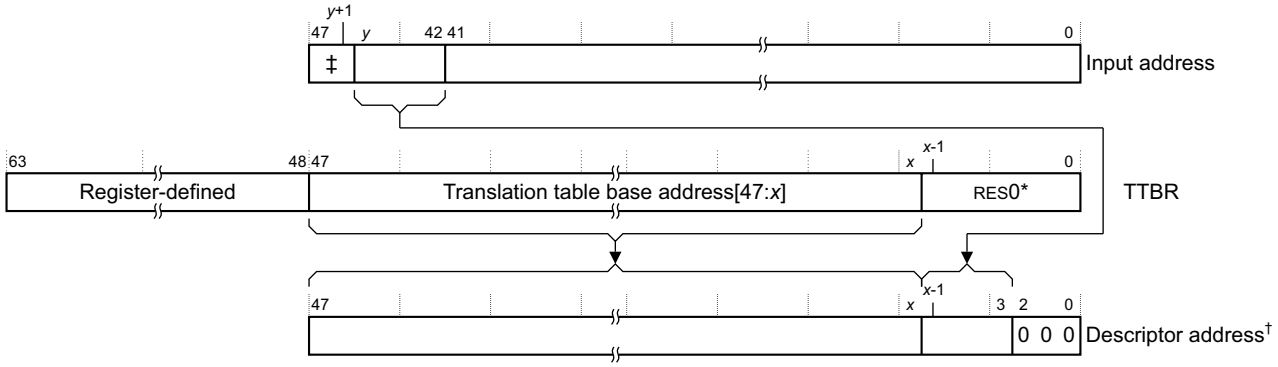
**Note**

For stage 2 translations, the same principles apply to an initial lookup that Table D4-18 on page D4-1770 shows as starting at level 2. In this case, for some IA sizes concatenation of translation tables means the lookup can, instead, start at level 3.

The following subsections describe these examples of the initial lookup:

- *Initial lookup at level 1, 64KB translation granule*.
- *Initial lookup at level 2, 64KB translation granule* on page K7-5578.

In all cases, for a stage 2 translation, the VTCR_EL2.SL0 field must indicate the required initial lookup level, and this level must be consistent with the value of the VTCR_EL2.T0SZ field, see *Overview of stage 2 translations, 64KB granule* on page D4-1770.



### *Initial lookup at level 1, 64KB translation granule*

This subsection describes initial lookups with an input address width of ($n$+1) bits, meaning the input address is IA[$n$:0]. As Table D4-18 on page D4-1770 shows, a stage 1 or stage 2 initial lookup at level 1 is required when $42 \le n \le 47$. For these lookups:

- The size of the translation table is $2^{(n-39)}$ bytes. This means the size of the translation table, at this level, is always less than the granule size. The address of this translation table must align to the size of the table.
- Bits[$n$:42] of the input address are bits[($n$-39):3] of the descriptor offset in the translation table.
- Bits[47:($n$-38)] of the TTBR specify the translation table base address.

Figure K7-7 on page K7-5578 shows this lookup.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

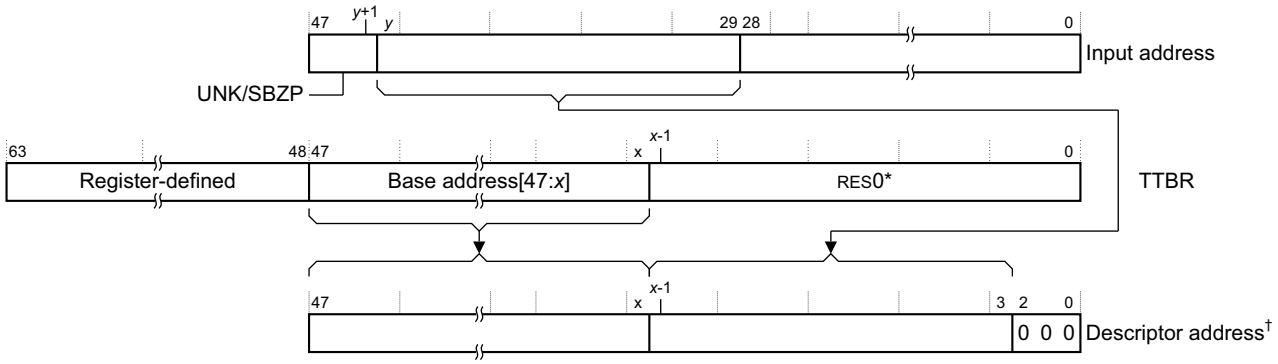
Supported input address range is IA[*y*:0], 4 ≤ *x* ≤ 9, *y* = *x* + 38. When *y* is 47 the field marked ‡ is absent.

† For a Non-secure EL1&0 stage 1 translation, the IPA of the descriptor. Otherwise, the PA of the descriptor.

* Field has additional properties to the default RES0 definition, see the register description for more information.

**Figure K7-7 Initial lookup for VMSAv8-64 using the 64KB granule, starting at level 1**

### *Initial lookup at level 2, 64KB translation granule*



This subsection describes initial lookups with an input address width of (*n*+1) bits, meaning the input address is IA[*n*:0].

**For a stage 1 or stage 2 initial lookup at level 2, without the use of concatenated translation tables**

As Table D4-18 on page D4-1770 shows, this applies to IA[*n*:0], where 29 ≤ *n* ≤ 41. For these lookups:

- There is a single translation table at this level.
- TTBR[47:(*n*-25)] of the specify the translation table base address.
- Bits[*n*:29] of the input address are bits[(*n*-26):3] of the descriptor offset in the translation table.

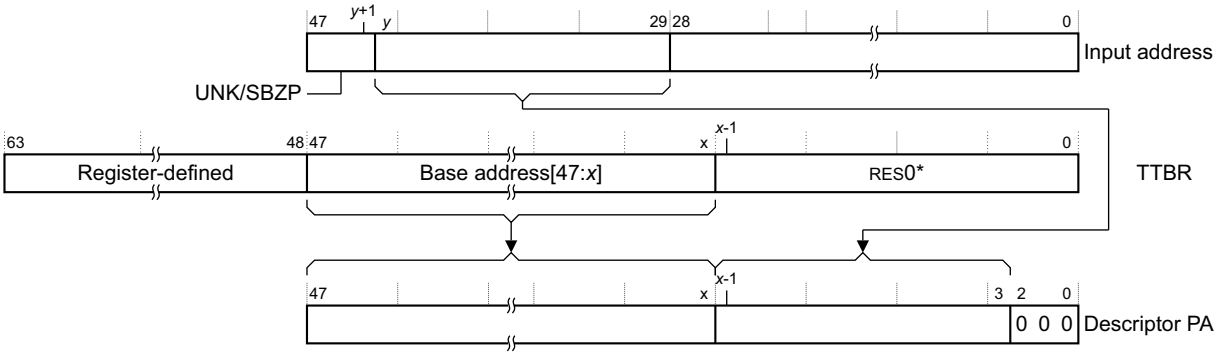
Figure K7-8 shows this lookup.

Supported input address range is IA[*y*:0]. 4 ≤ *x* ≤ 16, *y* = *x* + 25.

† For a Non-secure EL1&0 stage 1 translation, the IPA of the descriptor. Otherwise, the PA of the descriptor.

* Field has additional properties to the default RES0 definition, see the register description for more information.

**Figure K7-8 Initial lookup for VMSAv8-64 using the 64KB granule, starting at level 2, without concatenation**



*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**For a stage 2 initial lookup at level 2, with concatenated translation tables**

As Table D4-18 on page D4-1770 shows, this applies to IA[$n$:0], where $42 \le n \le 45$. For these lookups:

- There are $2^{(m-41)}$ concatenated translation tables at this level.
- These concatenated translation tables must be aligned to $2^{(m-41)} \times 64$KB. This means TTBR[($n$-26):16] must be zero.
- TTBR[47:($n$-25)] specify the base address of the block of translation tables.
- Bits[$n$:42] of the input address are bits[($n$-26):16] of the descriptor offset from the base address of the block of translation tables.

Figure K7-9 shows this lookup.

Supported input address range is IPA[$y$:0], $4 \le x \le 20$, $y = x + 25$.

* Field has additional properties to the default RES0 definition, see the register description for more information.

**Figure K7-9 Initial lookup for VMSAv8-64 using the 64KB granule, starting at level 2, with concatenation**

## K7.1.2 Full translation flows for VMSAv8-64 address translation

In a translation table walk, only the first lookup uses the translation table base address from the appropriate TTBR. Subsequent lookups use a combination of address information from:

- The table descriptor read in the previous lookup.
- The input address.

This section describes example full translation flows, from the initial lookup to the address of a memory page. The example flows:

- Resolve the maximum-sized IA range supported by the initial lookup level.
- Do not have any concatenation of translation tables.
- Cover only the 4KB and the 64KB translation granules.

*Examples of performing the initial lookup* on page K7-5572 described how either reducing the IA range or concatenating translation tables affects the initial lookup.

**Note**

Reducing the IA range or concatenating translation tables affects only the initial lookup.

The following sections describe full VMSAv8-64 translation flows, down to an entry for a memory page:

- *The address and properties fields shown in the translation flows* on page K7-5580.
- *Full translation flow using the 4KB granule and starting at level 0* on page K7-5581.
- *Full translation flow using the 4KB granule and starting at level 1* on page K7-5582.
- *Full translation flow using the 64KB granule and starting at level 1* on page K7-5583.
- *Full translation flow using the 64KB granule and starting at level 2* on page K7-5584.

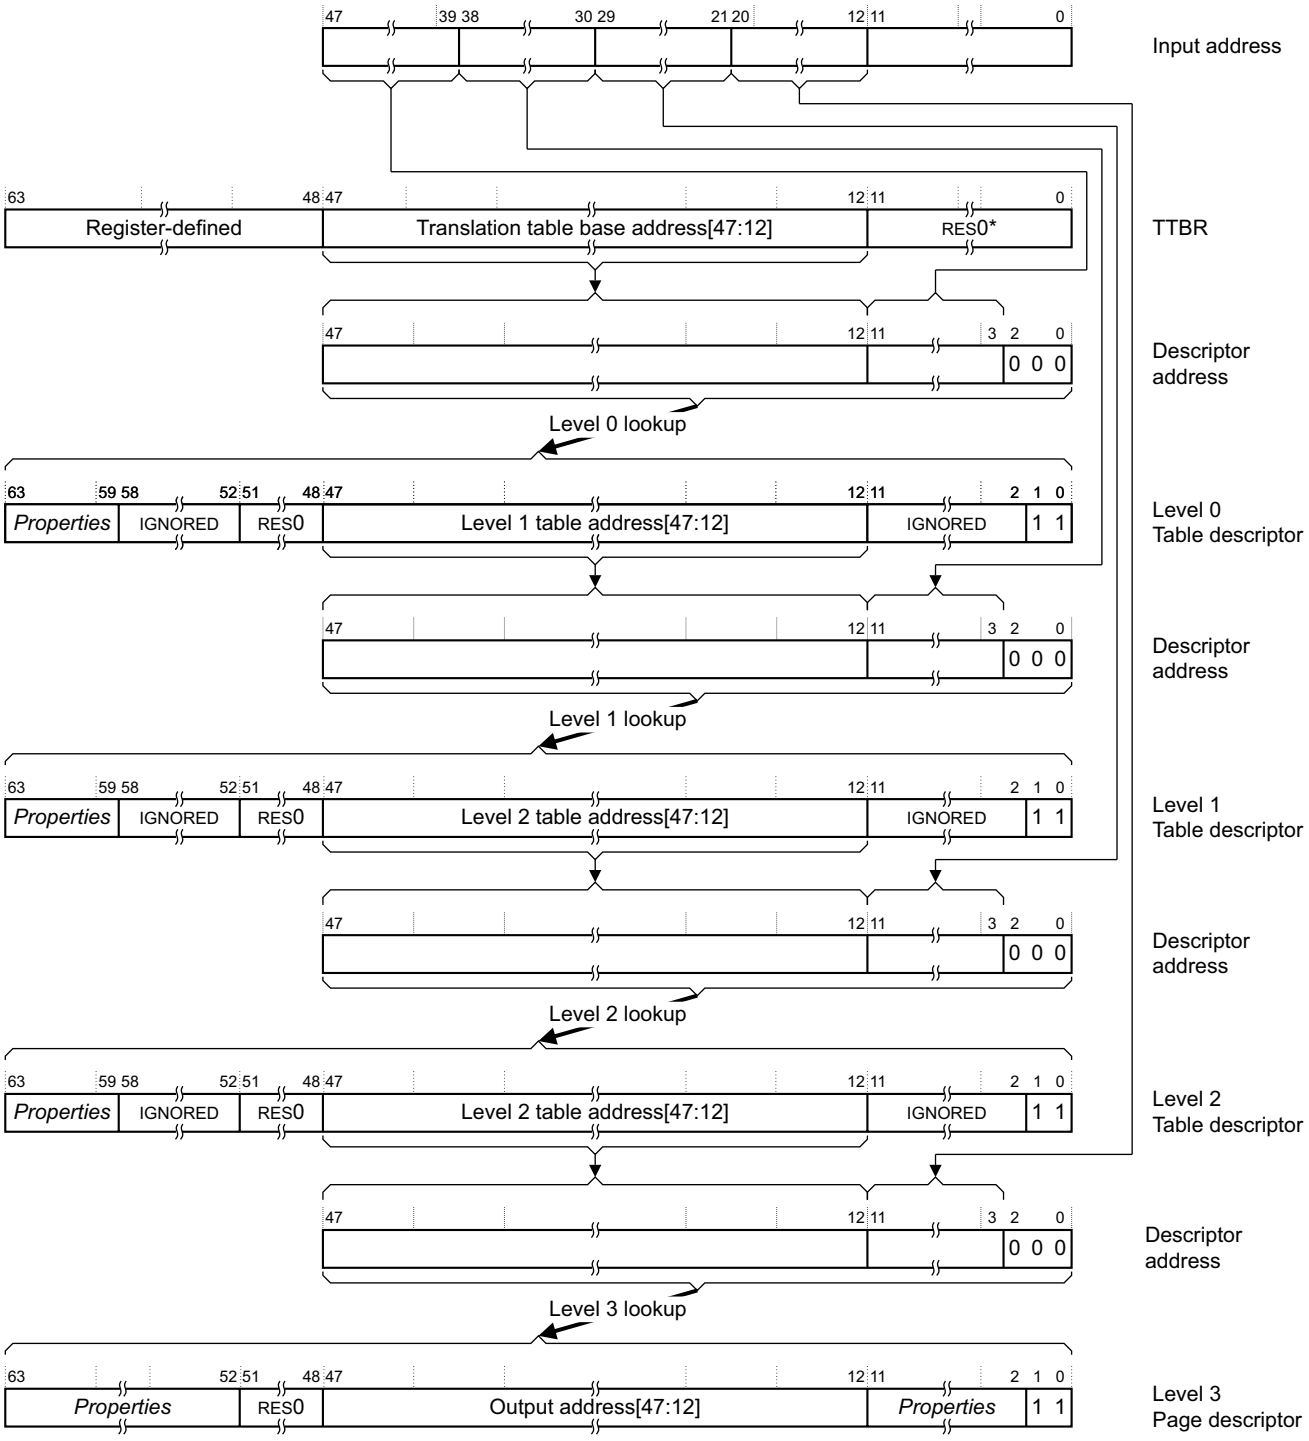
*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### The address and properties fields shown in the translation flows

For the Non-secure EL1&0 stage 1 translation:

- Any descriptor address is the IPA of the required descriptor.
- The final output address is the IPA of the block or page.

In these cases, an EL1&0 stage 2 translation is performed to translate the IPA to the required PA.



For all other translations, the final output address is the PA of the block or page, and any descriptor address is the PA of the descriptor.

*Properties* indicates register or translation table fields that return information, other than address information, about the translation or the targeted memory region. For more information see *Memory attribute fields in the VMSAv8-64 translation table format descriptors* on page D4-1803.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

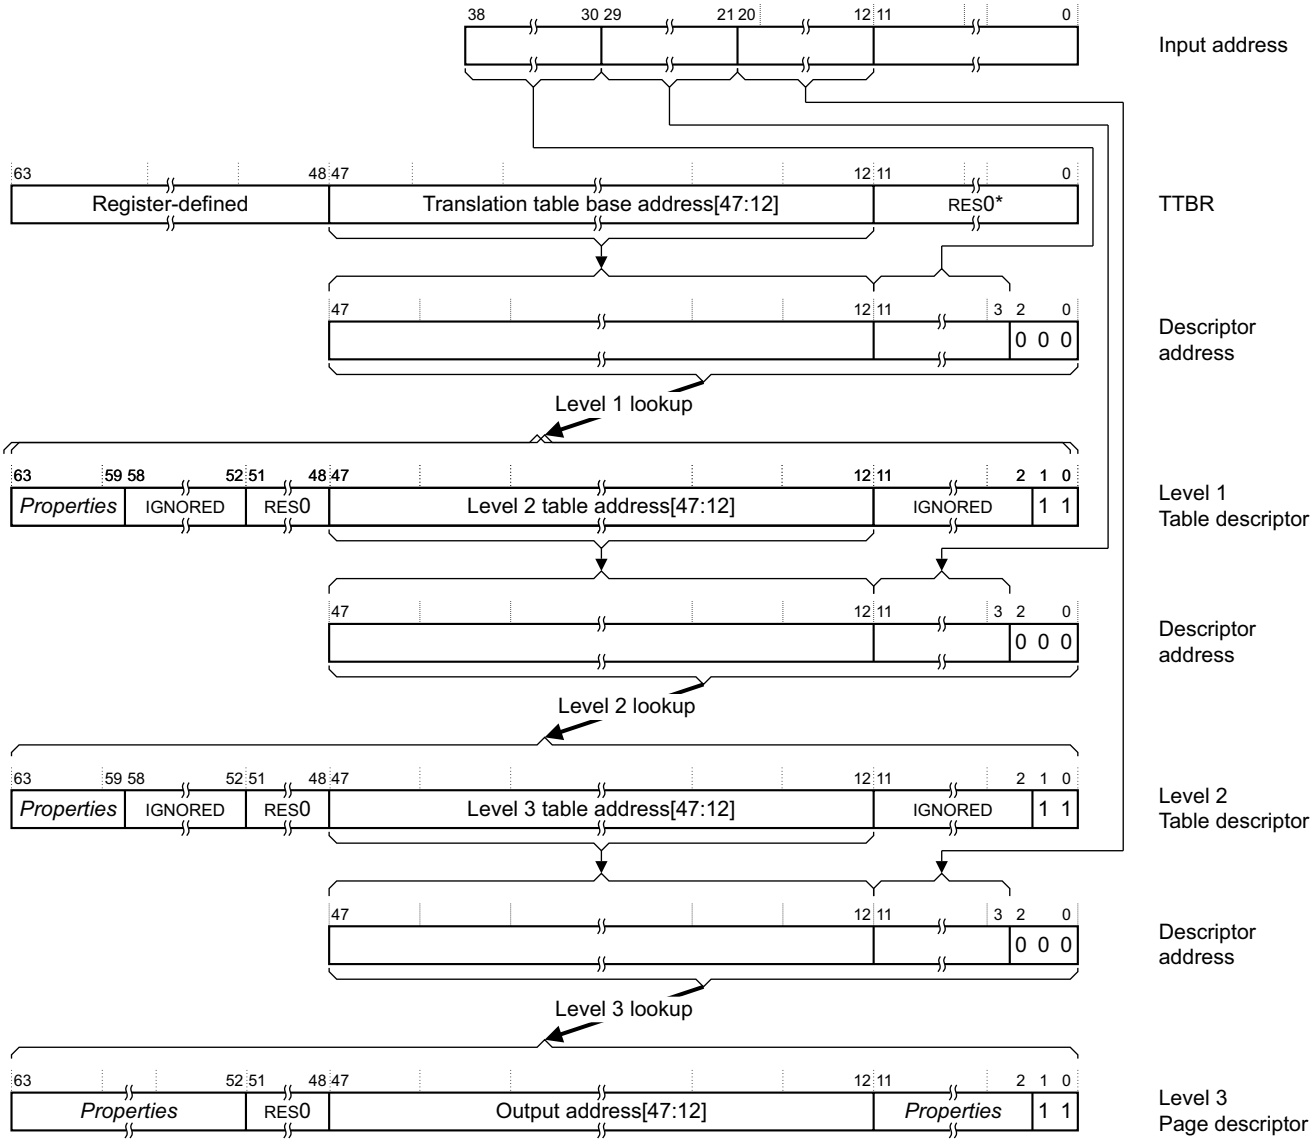
### Full translation flow using the 4KB granule and starting at level 0

Figure K7-10 shows the complete translation flow for a stage 1 translation table walk for a 48-bit input address. This lookup must start with a level 0 lookup. For more information about the fields shown in the figure see *The address and properties fields shown in the translation flows* on page K7-5580.

For details of *Properties* fields, see the register or descriptor description.

* Field has additional properties to the default RES0 definition, see the register description for more information.

**Figure K7-10 Complete stage 1 translation of a 48-bit address using the 4KB translation granule**



*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

If the level 1 lookup or level 2 lookup returns a block descriptor then the translation table walk completes at that level.

Figure K7-10 on page K7-5581 shows a stage 1 translation. The only difference for a stage 2 translation is that bits[63:58] of the Table descriptors are SBZ.

### Full translation flow using the 4KB granule and starting at level 1

Figure K7-11 shows the complete translation flow for a stage 1 translation table walk for a 39-bit input address. This lookup must start with a level 1 lookup. For more information about the fields shown in the figure see *The address and properties fields shown in the translation flows* on page K7-5580.

For details of *Properties* fields, see the register or descriptor description.

* Field has additional properties to the default RES0 definition, see the register description for more information.

**Figure K7-11 Complete stage 1 translation of a 39-bit address using the 4KB translation granule**

If the level 1 lookup or the level 2 lookup returns a block descriptor then the translation table walk completes at that level.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

Figure K7-11 on page K7-5582 shows a stage 1 translation. The only difference for a stage 2 translation is that bits[63:58] of the Table descriptors are SBZ.

Comparing this translation with the translation for a 48-bit address, shown in Figure K7-10 on page K7-5581, shows how the translation for the 42-bit address start the same lookup process one stage later.

### Full translation flow using the 64KB granule and starting at level 1

Figure K7-10 on page K7-5581 shows the complete translation flow for a stage 1 translation table walk for a 48-bit input address. This lookup must start with a level 0 lookup. For more information about the fields shown in the figure see *The address and properties fields shown in the translation flows* on page K7-5580.

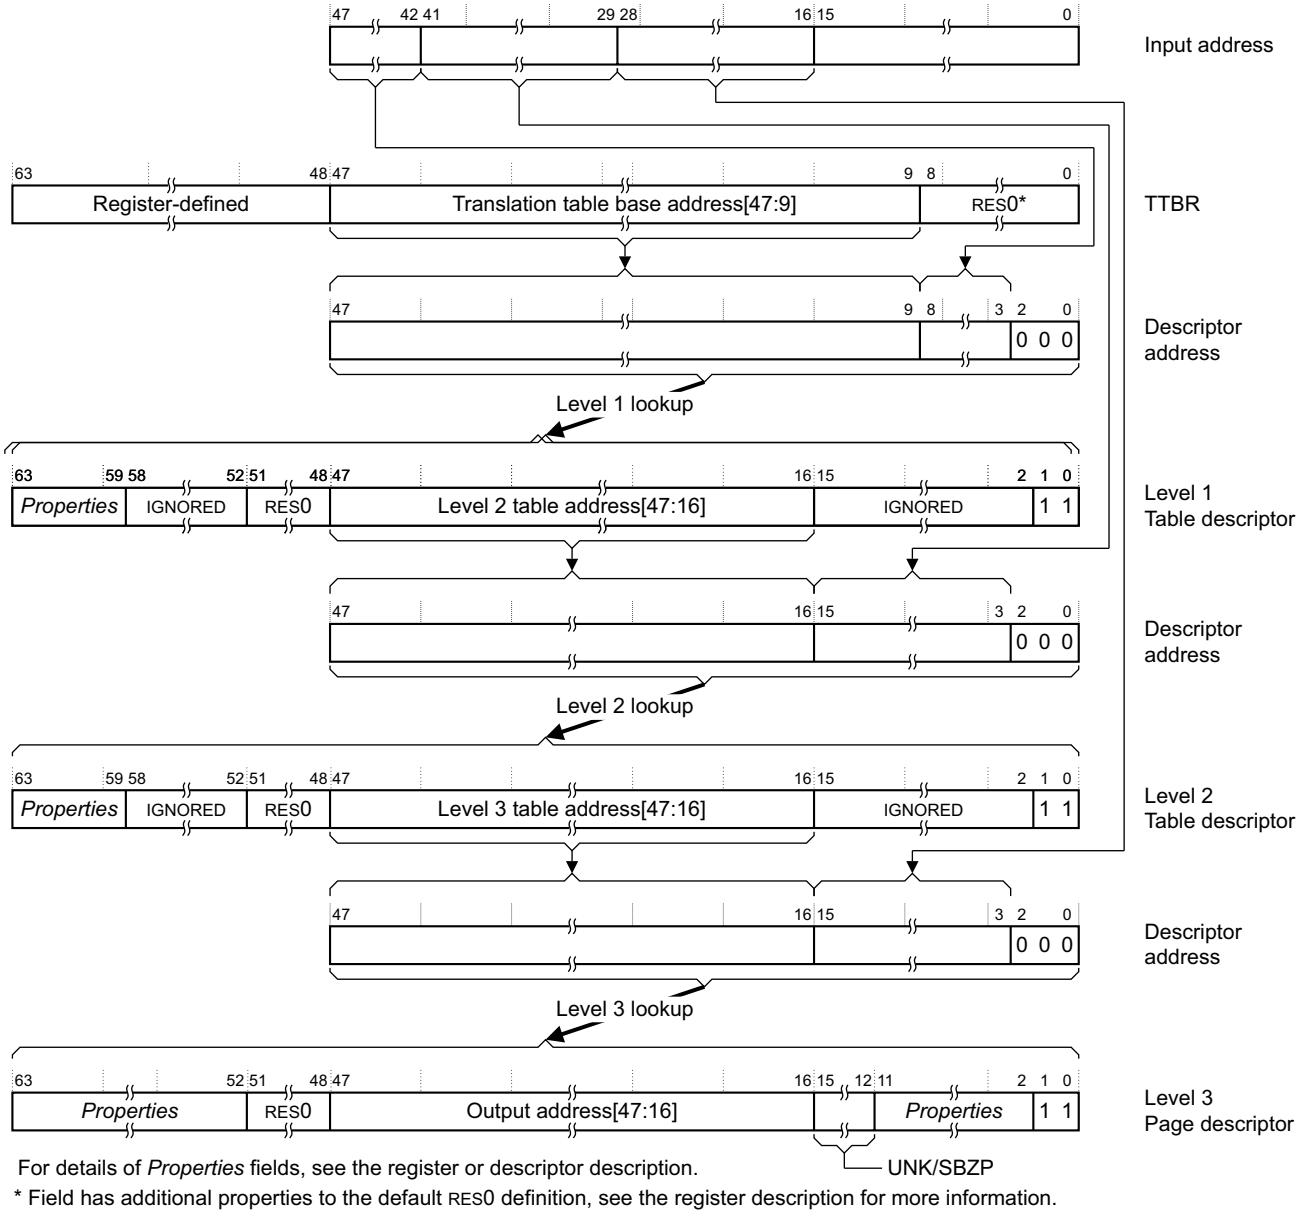


**Figure K7-12 Complete stage 1 translation of a 48-bit address using the 64KB translation granule**

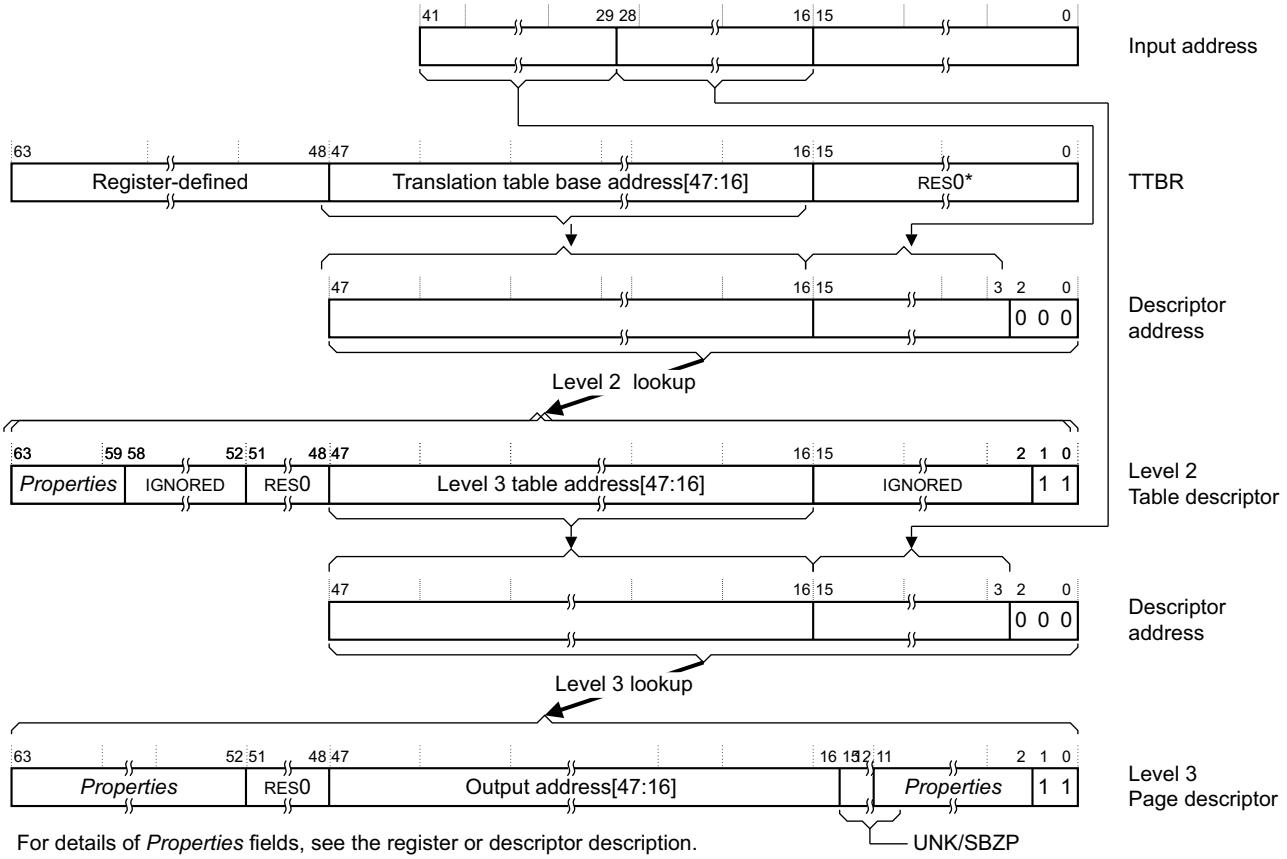
If the level 2 lookup returns a block descriptor then the translation table walk completes at that level.

Figure K7-12 shows a stage 1 translation. The only difference for a stage 2 translation is that bits[63:58] of the Table descriptors are SBZ.



*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

The level 1 lookup resolves only 6 bits of the input address. As described in *Performing the initial lookup using the 64KB translation granule* on page K7-5577, this means:

- The translation table size for this level is only 512 bytes.
- The required translation table alignment for this level is 512 bytes.
- The Base address field in the TTBR is extended, at the low-order end, to be bits[47:9].

### Full translation flow using the 64KB granule and starting at level 2

Figure K7-11 on page K7-5582 shows the complete translation flow for a stage 1 translation table walk for a 42-bit input address. This lookup must start with a level 2 lookup. For more information about the fields shown in the figure see *The address and properties fields shown in the translation flows* on page K7-5580.

For details of *Properties* fields, see the register or descriptor description.
* Field has additional properties to the default RES0 definition, see the register description for more information.

**Figure K7-13 Complete stage 1 translation of a 42-bit address using the 64KB translation granule**

If the level 2 lookup returns a block descriptor then the translation table walk completes at that level.

Figure K7-13 shows a stage 1 translation. The only difference for a stage 2 translation is that bits[63:58] of the Table descriptors are SBZ.

Comparing this translation with the translation for a 48-bit address, shown in Figure K7-12 on page K7-5583, shows:

- The translation for the 42-bit address starts the same lookup process one stage later.
- Because the initial lookup resolves 13 bits of address:
  - The translation table size for this level is 64KB.
  - The required translation table alignment for this level is 64KB.
  - The Base address field in the TTBR is bits[47:16].

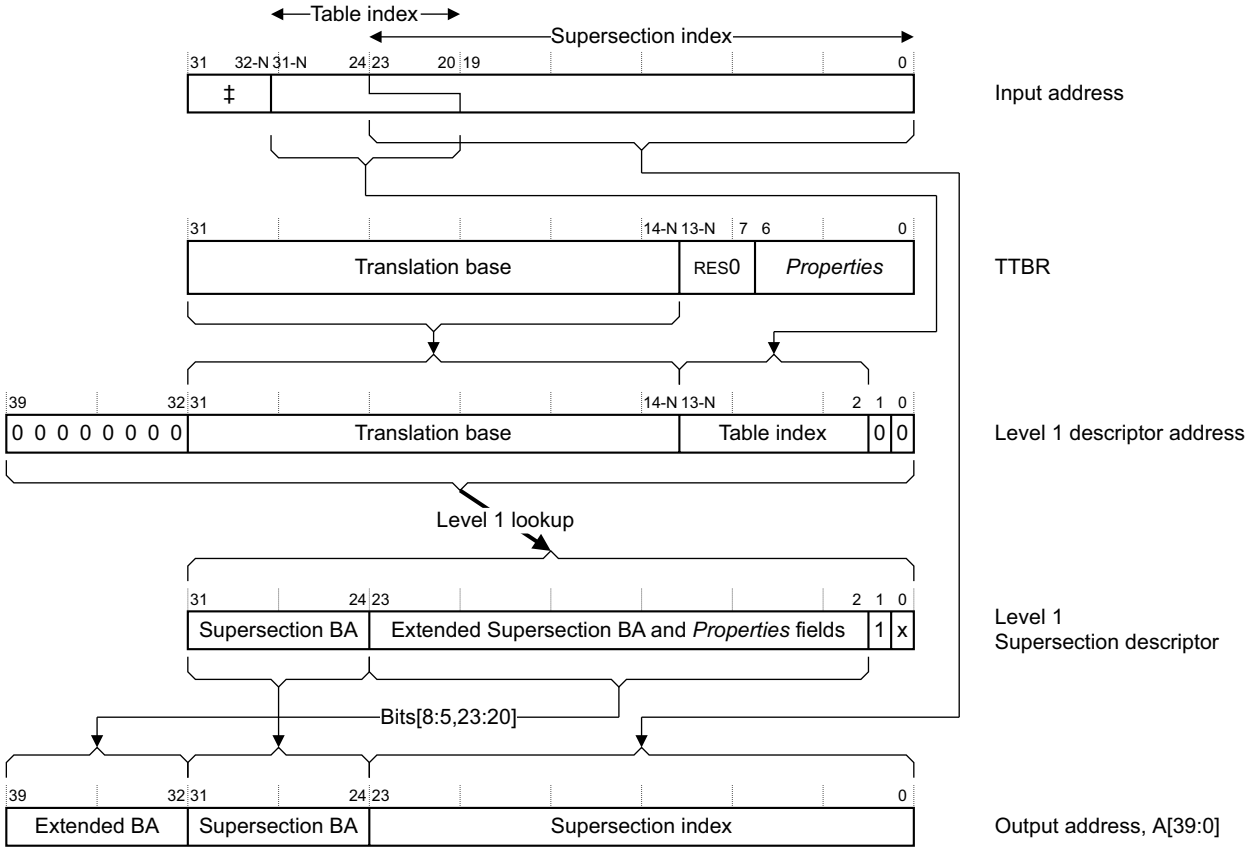
## K7.2 AArch32 Address translation examples

The following sections give address translation examples for the VMSAv8-32 address translation formats:

- *Address translation examples using the VMSAv8-32 Short descriptor translation table format*.
- *Address translation examples using the VMSAv8-32 Long descriptor translation table format* on page K7-5590.

### K7.2.1 Address translation examples using the VMSAv8-32 Short descriptor translation table format

*VMSAv8-32 Short-descriptor translation table format descriptors* on page G4-4010 describes the memory section and page option for a single VMSAv8-32 address translation. The following sections show the full translation flow for each of these options:



- *Translation flow for a Supersection* on page K7-5586.
- *Translation flow for a Section* on page K7-5587.
- *Translation flow for a Large page* on page K7-5588.
- *Translation flow for a Small page* on page K7-5589.

*The address and Properties fields shown in the translation flows* on page K7-5590 summarizes the information returned by the lookup.

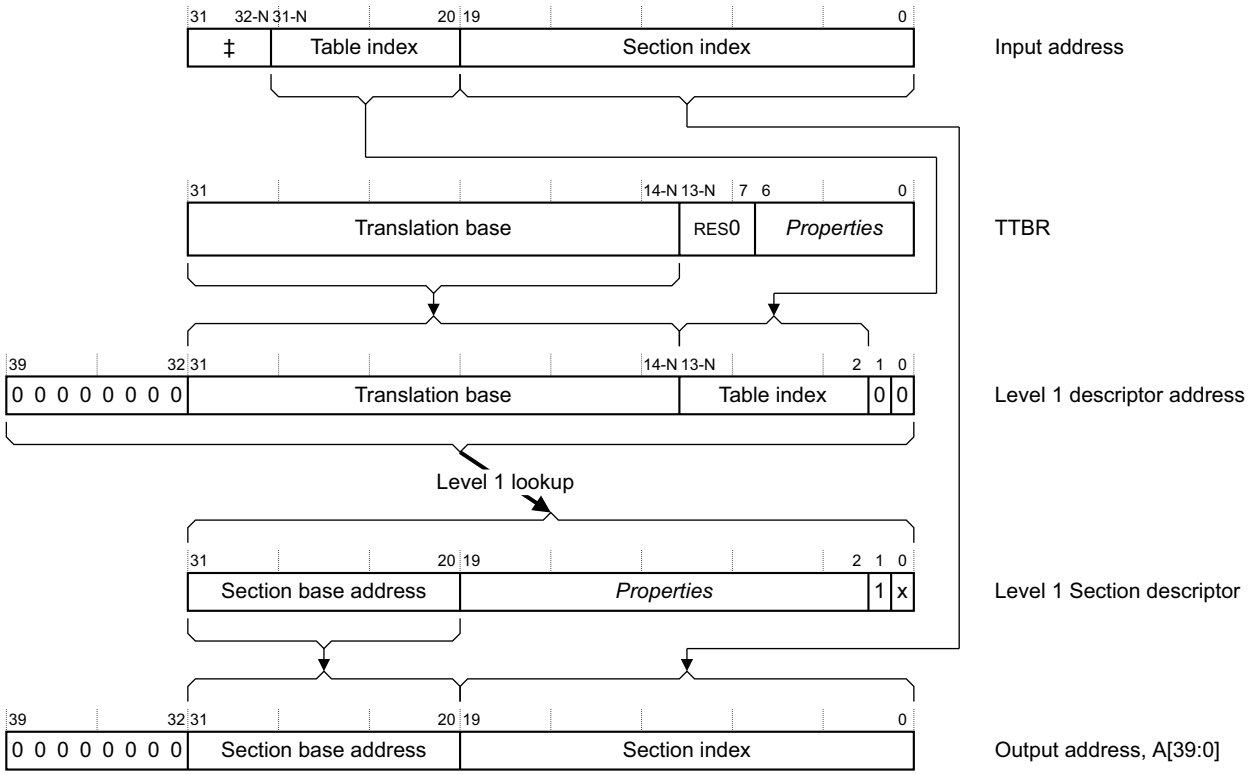
Non-Confidential - Beta

### Translation flow for a Supersection

Figure K7-14 shows the complete translation flow for a Supersection. For more information about the fields shown in this figure see *The address and Properties fields shown in the translation flows* on page K7-5590.

‡ This field is absent if N is 0
BA = Base address
For a translation based on TTBR0, N is the value of TTBCR.N
For a translation based on TTBR1, N is 0
For details of *Properties* fields, see the register or descriptor description

**Figure K7-14 VMSAv8-32 Short-descriptor Supersection address translation**



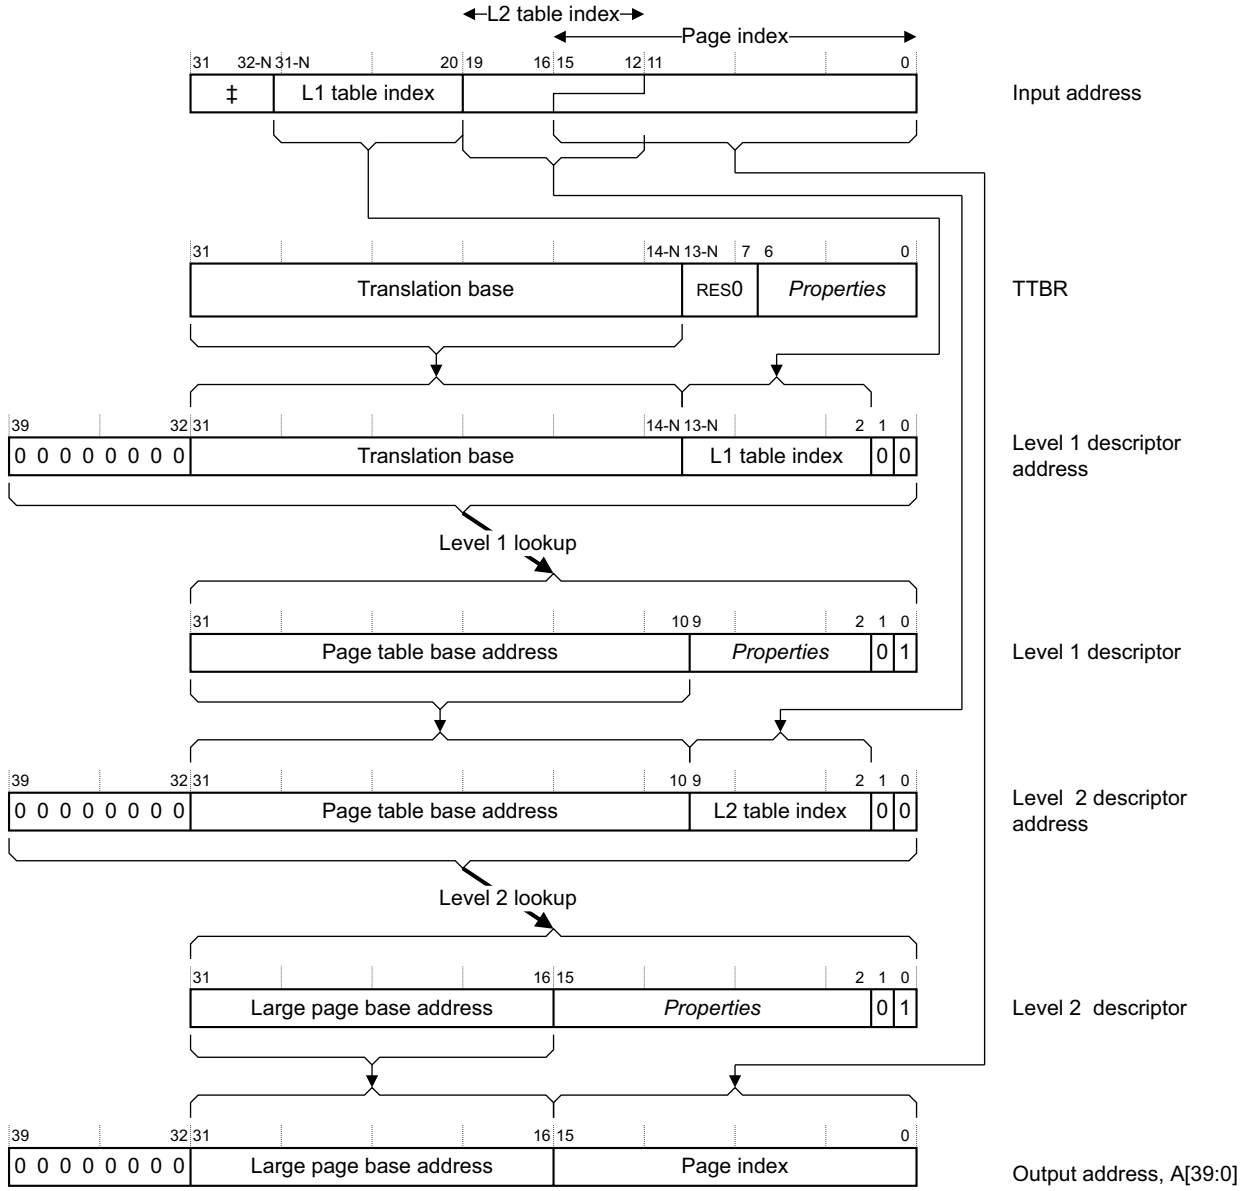
**Note**

Figure K7-14 shows how, when the input address, the VA, addresses a Supersection, the top four bits of the *Supersection index* bits of the address overlap the bottom four bits of the *Table index* bits. For more information, see *Additional requirements for Short-descriptor format translation tables* on page G4-4013.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### Translation flow for a Section

Figure K7-15 shows the complete translation flow for a Section. For more information about the fields shown in this figure see *The address and Properties fields shown in the translation flows* on page K7-5590.



‡ This field is absent if N is 0
For a translation based on TTBR0, N is the value of TTBCR.N
For a translation based on TTBR1, N is 0
For details of *Properties* fields, see the register or descriptor description.

**Figure K7-15 VMSAv8-32 Short-descriptor Section address translation**

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*

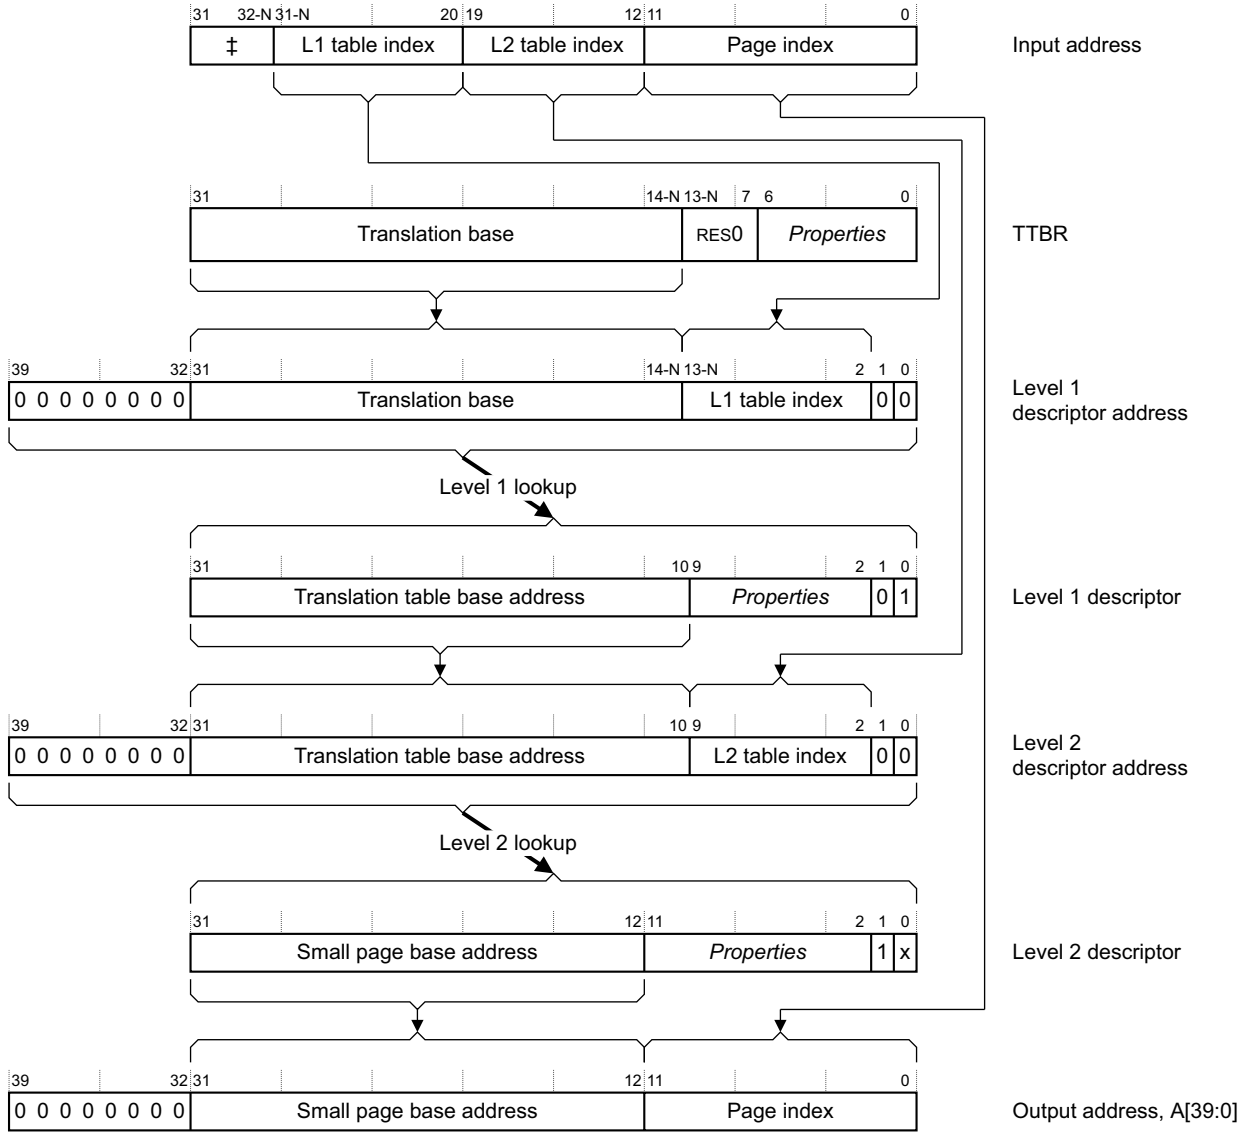
### Translation flow for a Large page

Figure K7-16 shows the complete translation flow for a Large page. For more information about the fields shown in this figure see *The address and Properties fields shown in the translation flows* on page K7-5590.

‡ This field is absent if N is 0
L1 = Level 1, L2 = Level 2
For a translation based on TTBR0, N is the value of TTBCR.N
For a translation based on TTBR1, N is 0
For details of *Properties* fields, see the register or descriptor description

**Figure K7-16 VMSAv8-32 Short-descriptor Large page address translation**



**Note**

Figure K7-16 shows how, when the input address, the VA, addresses a Large page, the top four bits of the *page index* bits of the address overlap the bottom four bits of the *level 1 table index* bits. For more information, see *Additional requirements for Short-descriptor format translation tables* on page G4-4013.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### Translation flow for a Small page

Figure K7-17 shows the complete translation flow for a Small page. For more information about the fields shown in this figure see *The address and Properties fields shown in the translation flows* on page K7-5590.

‡ This field is absent if N is 0
L1 = Level 1, L2 = Level 2
For a translation based on TTBR0, N is the value of TTBCR.N
For a translation based on TTBR1, N is 0
For details of *Properties* fields, see the register or descriptor description.

**Figure K7-17 VMSAv8-32 Short-descriptor Small page address translation**

### The address and Properties fields shown in the translation flows

For the Non-secure PL1&0 stage 1 translation tables:

- Any descriptor address is the IPA of the required descriptor.
- The final output address is the IPA of the Section, Supersection, Large page, or Small page.

In these cases, a PL1&0 stage 2 translation is performed to translate the IPA to the required PA.

Otherwise, the address is the PA of the descriptor, Section, Supersection, Large page, or Small page.

*Properties* indicates register or translation table fields that return information, other than address information, about the translation or the targeted memory region. For more information see *Information returned by a translation table lookup* on page G4-4005, and the description of the register or translation table descriptor.

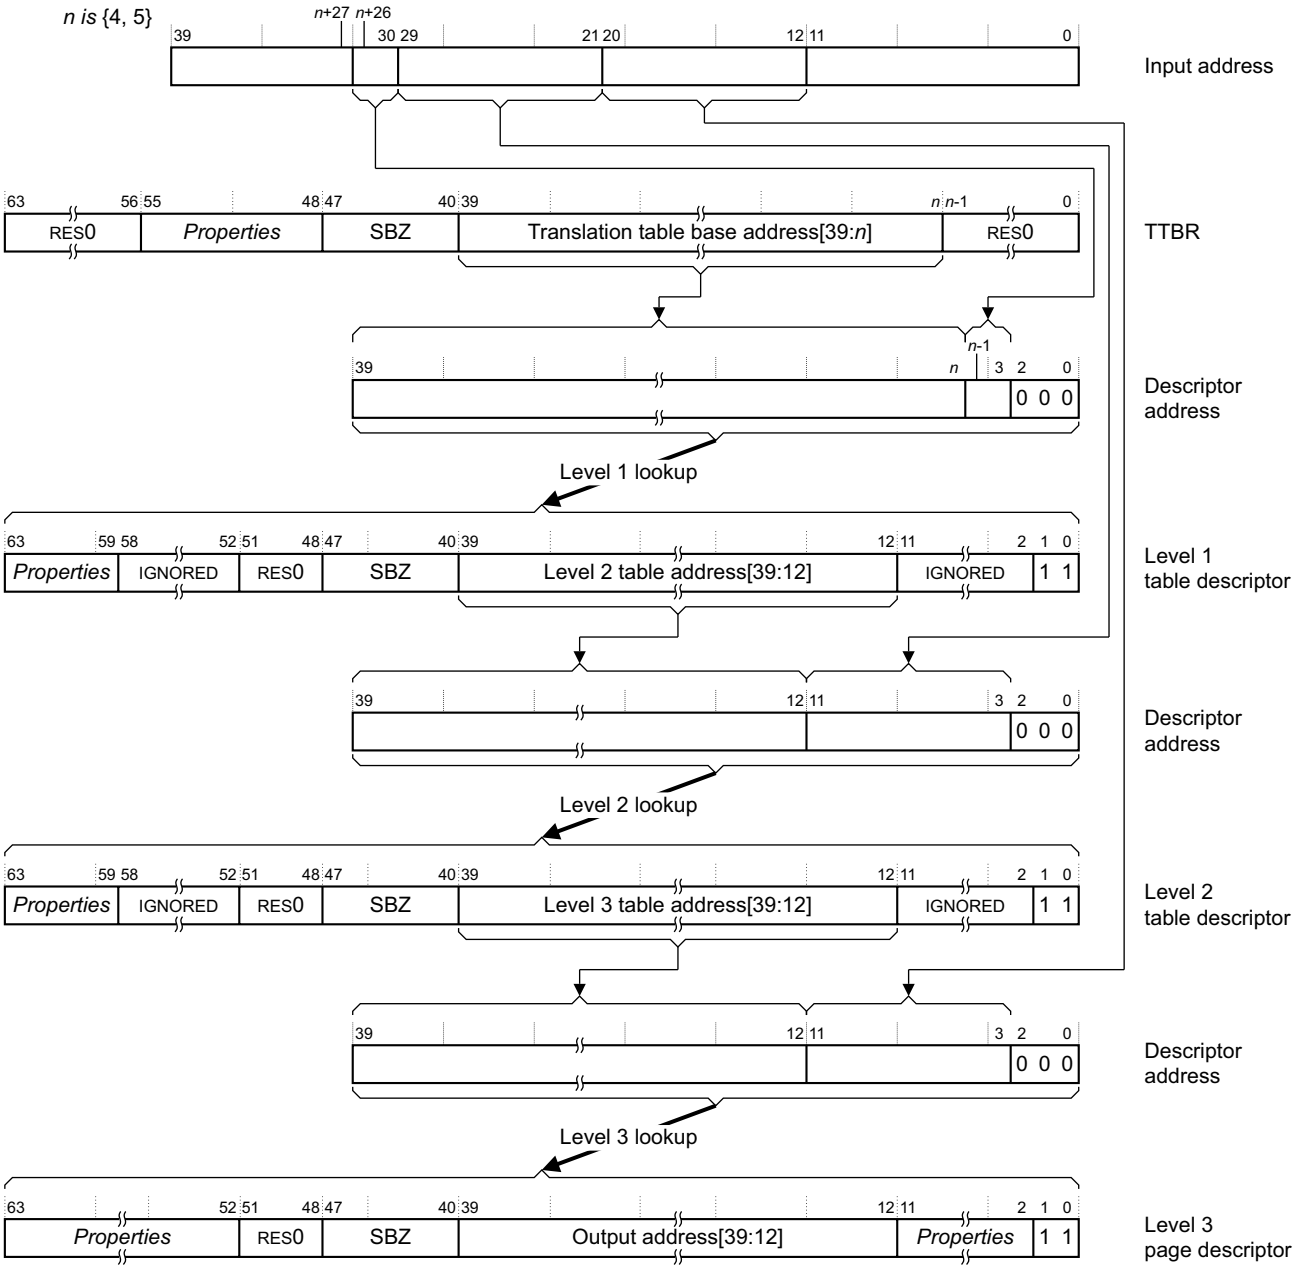
For translations using the Short-descriptor translation table format, *VMSAv8-32 Short-descriptor translation table format descriptors* on page G4-4010 describes the descriptors formats.

## K7.2.2 Address translation examples using the VMSAv8-32 Long descriptor translation table format

As described in *Translation table walks, when using the VMSAv8-32 Long-descriptor translation table format* on page G4-4032, in a translation table walk, only the first lookup uses the translation table base address from the appropriate TTBR. Subsequent lookups use a combination of address information from:

- The table descriptor read in the previous lookup.
- The input address.

The following sections give examples of full VMSAv8-32 Long-descriptor format address translation flows, down to an entry for a 4KB page:



- *Full translation flow, starting at level 1 lookup* on page K7-5591.
- *Full translation flow, starting at level 2 lookup* on page K7-5592.

*The address and Properties fields shown in the translation flows* summarizes the information returned by the lookup.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

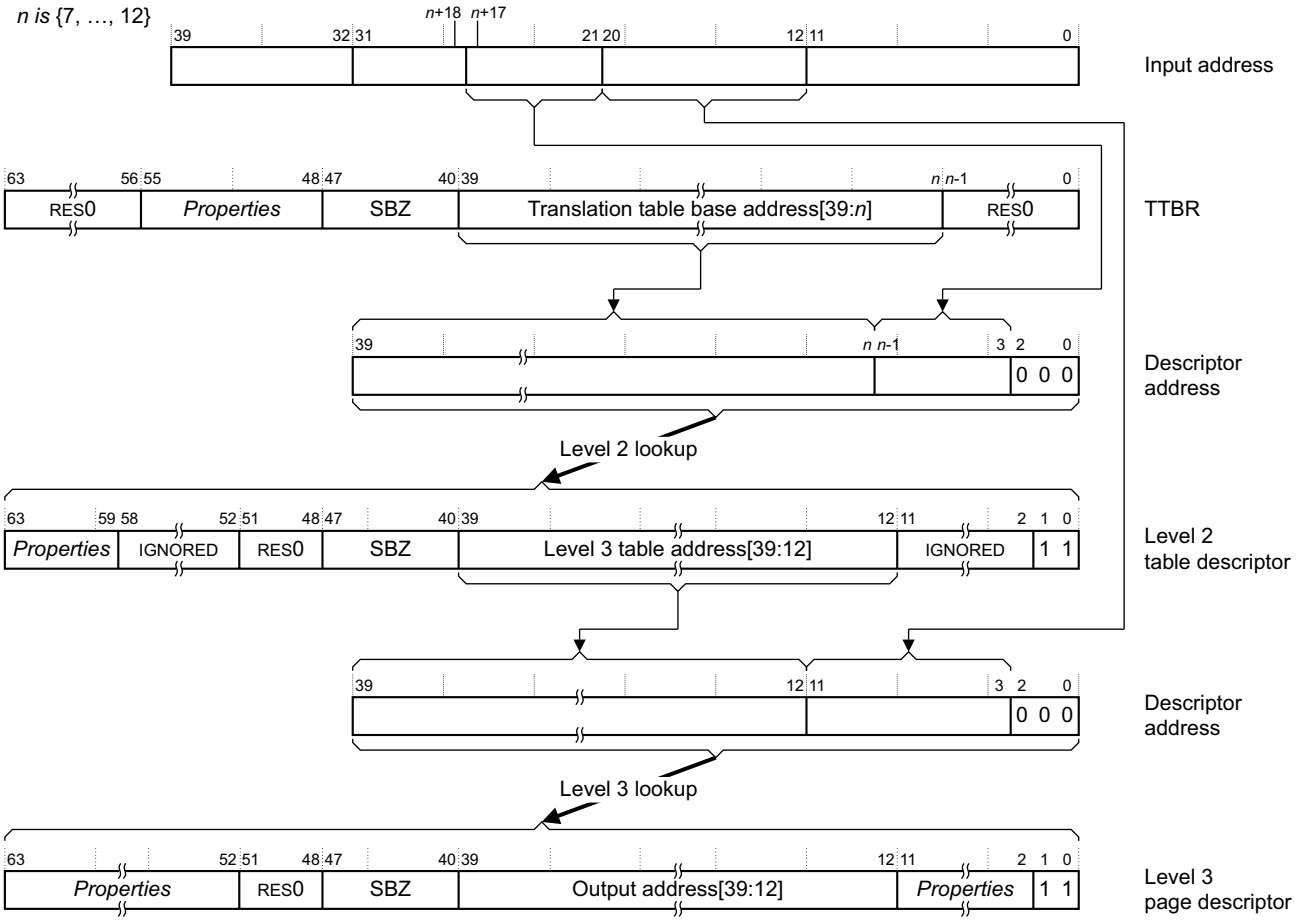
### Full translation flow, starting at level 1 lookup

Figure K7-18 shows the complete translation flow for a VMSAv8-32 Long-descriptor stage 1 translation table walk that starts with a level 1 lookup. For more information about the fields shown in the figure see *The address and Properties fields shown in the translation flows* on page K7-5590.

For details of *Properties* fields, see the register or descriptor description.

**Figure K7-18 Complete VMSAv8-32 Long-descriptor format stage 1 translation, starting at level 1**

If the level 1 lookup or the level 2 lookup returns a block descriptor then the translation table walk completes at that level.



*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

A stage 2 translation that starts at a level 1 lookup differs from the translation shown in Figure K7-18 on page K7-5591 only as follows:

- The possible values of *n* are 4-13, to support an input address of between 31 and 40 bits.
- A descriptor and output addresses are always PAs.

### Full translation flow, starting at level 2 lookup

Figure K7-19 shows the complete translation flow for a stage 1 VMSAv8-32 Long-descriptor translation table walk that starts at a level 2 lookup. For more information about the fields shown in the figure see *The address and Properties fields shown in the translation flows* on page K7-5590.

For details of *Properties* fields, see the register or descriptor description.

**Figure K7-19 Complete VMSAv8-32 Long-descriptor format stage 1 translation, starting at level 2**

If the level 2 lookup returns a block descriptor then the translation table walk completes at that level.

A stage 2 translation that starts at a level 2 lookup differs from the translation shown in Figure K7-19 only as follows:

- The possible values of *n* are 7-16, to support an input address of up to 34 bits.
- The descriptor and output addresses are always PAs.

### The address and Properties fields shown in the translation flows

For the Non-secure PL1&0 stage 1 translation:

- Any descriptor address is the IPA of the required descriptor.
- The final output address is the IPA of the block or page.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

In these cases, a PL1&0 stage 2 translation is performed to translate the IPA to the required PA.

For all other translations, the final output address is the PA of the block or page, and any descriptor address is the PA of the descriptor.

*Properties* indicates register or translation table fields that return information, other than address information, about the translation or the targeted memory region. For more information see *Information returned by a translation table lookup* on page G4-4005, and the description of the register or translation table descriptor.

For translations using the Long-descriptor translation table format, *VMSAv8-32 Long-descriptor translation table format descriptors* on page G4-4019 describes the descriptors formats.

# Appendix K8
# Example OS Save and Restore Sequences

This appendix provides possible OS Save and Restore sequences for a v8 Debug implementation. It contains the following sections:

- *Save Debug registers* on page K8-5596.
- *Restore Debug registers* on page K8-5598.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K8.1 Save Debug registers

This section shows how to save the registers that are used by an external debugger.

```
; On entry, X0 points to a block to save the debug registers in.
; Returns the pointer beyond the block and corrupts X1-X3

SaveDebugRegisters
    ; (1) Set OS lock.
    MOV     X2,#1                       ; Set the OS lock. In AArch64 state, the OS lock
    MSR     OSLAR_EL1,X2                ; is writable via OSLAR.
    ISB                                 ; Context synchronization operation

    ; (2) Walk through the registers, saving them
    MRS     X1,OSDTRRX_EL1              ; Read DTRRX
    MRS     X2,OSDTRTX_EL1              ; Read DTRTX
    STP     W1,W2,[X0],#8               ; Save { DTRRX, DTRTX }
    MRS     X1,OSECCR_EL1               ; Read ECCR
    MRS     X2,MDSCR_EL1                ; Read DSCR
    STP     W1,W2,[X0],#8               ; Save { ECCR, DSCR }
    [ AARCH32_SUPPORTED
    MRS     X1,DBGVCR32_EL2             ; Read DBGVCR
    MRS     X2,DBGCLAIMCLR_EL1          ; Read CLAIM - note, have to read via CLAIMCLR
    STP     W1,W2,[X0],#8               ; Save { VCR, CLAIM }
    ]

    ;; Macros for saving off a "register pair"
    ;; $WB      is W for watchpoint, B for breakpoint
    ;; $num     is the pair's number
    ;; X0 contains a pointer for the value words
    ;; X1 contains a pointer for the control words
    ;; W2 contains the max index
    MACRO
    SaveRP  $WB,$num, $exit

# Appendix K9
# Recommended Upload and Download Processes for External Debug

This appendix contains the following section:

- *Using memory access mode in AArch64 state* on page K9-5602.

**Note**

This description is not part of the ARM architecture specification. It is included here as supplementary information, for the convenience of developers and users who might find this information useful.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K9.1 Using memory access mode in AArch64 state

Figure K9-1 and Figure K9-2 on page K9-5603 show the processes for using memory access mode to implement a download (external host to target) and an upload (target to external host).

To transfer *n* words of data:

- The download sequence needs *n*+6 accesses by the external debug interface.
- The upload sequence needs *n*+8 accesses by the external debug interface.

In both cases, in the innermost loop the debugger can make an external access to a DTR without polling EDSCR after each write as underrun and overrun detection prevent failure. Normally external accesses from the debugger are outpaced by the memory accesses of the PE, making underruns and overruns unlikely. If this is not the case, the EDSCR.ERR flag is set to 1. This is checked once at the end of the sequence, although a debugger can check it more often, for example once for each page. If the EDSCR.ERR flag is set to 1 because of overrun or underrun, the debugger can restart. The address to restart from is frozen in X0. EDSCR.ERR might also be set because of a Data abort.

If underruns and overruns are common, the debugger can pace itself accordingly.

**Note**

- The base address must be a multiple of 4.
- The order of the writes that set up the address does not matter in Debug state.

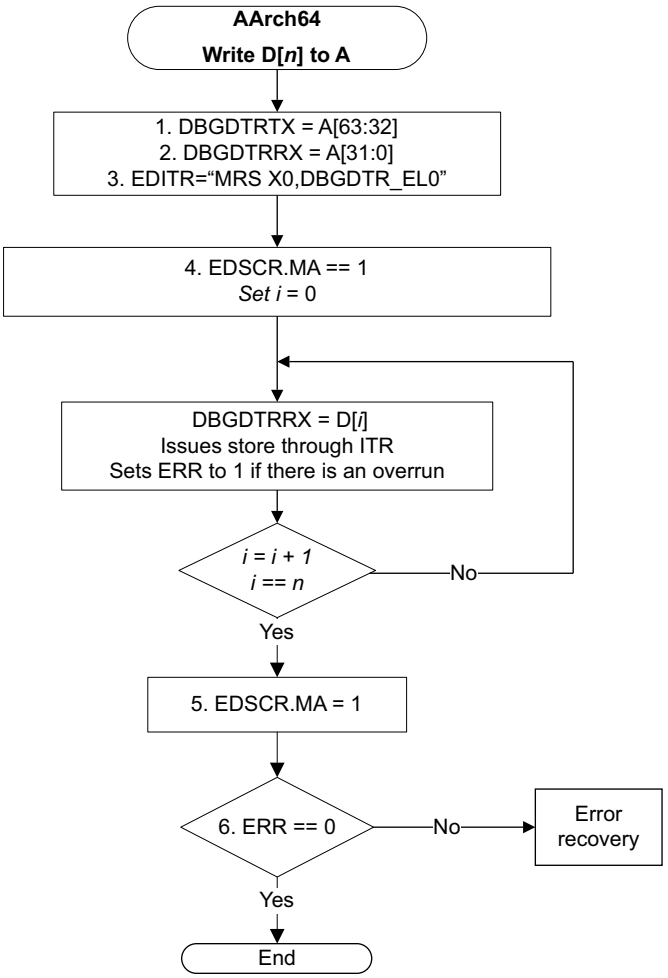

**Figure K9-1 Fast code download in AArch64 (external host to target)**

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

In Figure K9-1 on page K9-5602, the sequence for the fast code download is as follows:

1. Setup. From the external debug interface:
   a. Write address [31:0] to DBGDTRRX_EL0.
   b. Write address [63:32] to DBGDTRTX_EL0.
   c. Write `MRS X0, DBGDTR_EL0` to EDITR. The PE executes this instruction.
   d. Set EDSCR.MA to 1.
2. Loop *n* times. From the external debug interface:
   a. Write to DBGDTRRX_EL0. The PE reads the word from DTRRX and stores it to memory. It increments X0 by 4.
3. Epilogue. From the external debug interface:
   a. Clear EDSCR.MA to 0.
   b. Read EDSCR to check for overruns or Data Aborts during download.

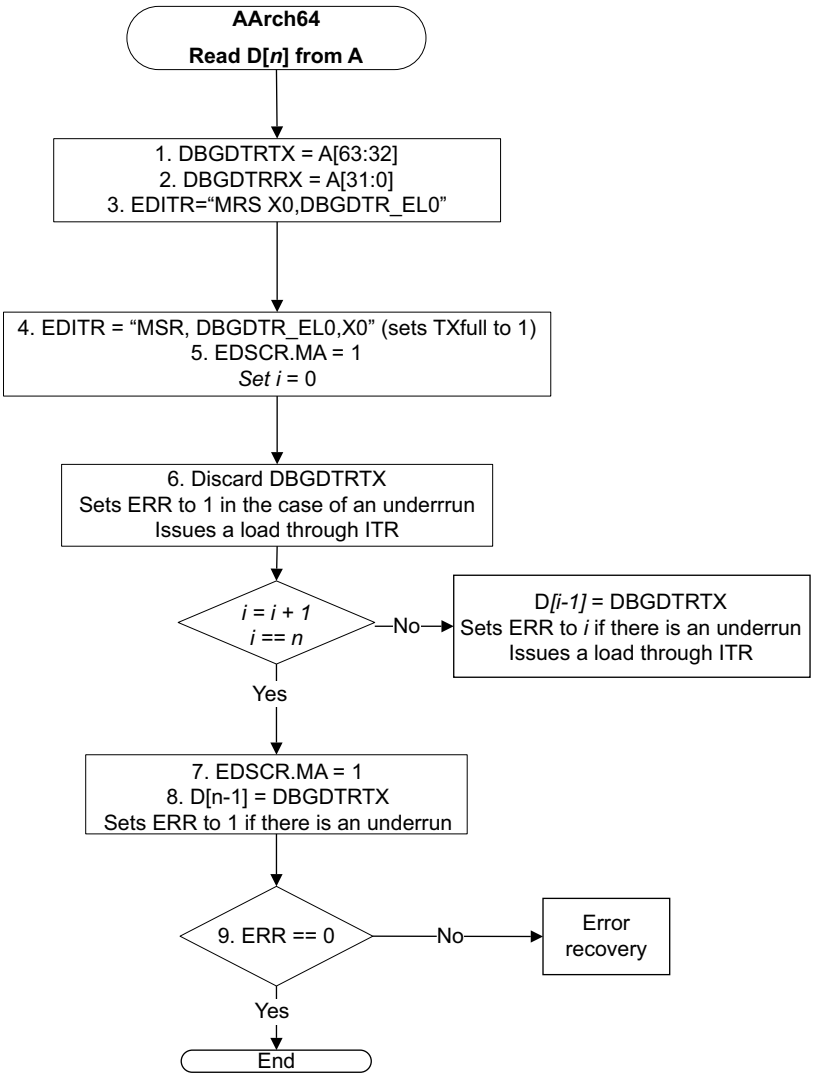

**Figure K9-2 Fast data upload in AArch64 (target to external host)**

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

In Figure K9-2 on page K9-5603, the sequence for the fast code download is as follows:

1. Setup. From the external debug interface:
   a. Write address [31:0] to DBGDTRRX_EL0.
   b. Write address [63:32] to DBGDTRTX_EL0.
   c. Write `MRS X0, DBGDTR_EL0` to EDITR.
   d. Write `MSR DBGDTR_EL0, X0` to EDITR. This dummy operation ensures EDSCR.TXfull == 1.
   e. Set EDSCR.MA to 1.
   f. Read DBGDTRTX_EL0 and discard the value. The PE returns the previous DTR value, loads the first word, and writes it to DTR. It increments X0 by 4.
2. Loop *n*-1 times. From the external debug interface:
   a. Read DBGDTRTX_EL0. The PE returns the previous DTRTX value, loads a new word, and writes it to DTRTX. It increments X0 by 4.
3. Epilogue. From the external debug interface:
   a. Clear EDSCR.MA to 0.
   b. Read DBGDTRTX_EL0 for the $n^{th}$ value.
   c. Read EDSCR to check for underruns, overruns or Data Aborts during upload.

# Appendix K10
# **Barrier Litmus Tests**

This appendix gives examples of the use of the barrier instructions provided by the ARMv8 architecture. It contains the following sections:

- *Introduction* on page K10-5606.
- *Load-Acquire, Store-Release and barriers* on page K10-5609.
- *Load-Acquire Exclusive, Store-Release Exclusive and barriers* on page K10-5616.
- *Using a mailbox to send an interrupt* on page K10-5621.
- *Cache and TLB maintenance instructions and barriers* on page K10-5622.
- *ARMv7 compatible approaches for ordering, using DMB and DSB barriers* on page K10-5633.

**Note**

This information is not part of the ARM architecture specification. It is included here as supplementary information, for the convenience of developers and users who might require this information.

# K10.1 Introduction

The exact rules for the insertion of barriers into code sequences is a very complicated subject, and this appendix describes many of the corner cases and behaviors that are possible in an implementation of the ARMv8 architecture.

This appendix is to help programmers, hardware design engineers, and validation engineers understand the need for the different kinds of barriers.

## K10.1.1 Overview of memory consistency

Early generations of microprocessors were relatively simple processing engines that executed each instruction in program order. In such processors, the effective behavior was that each instruction was executed in its entirety before a subsequent instruction started to be executed. This behavior is sometimes referred to as the *Sequential Execution Model* (SEM), and in this Manual it is described as *Simple sequential execution* of the program.

In later processor generations, the needs to increase processor performance, both in terms of the frequency of operation and the number of instructions executed each cycle, mean that such a simple form of execution is abandoned. Many techniques, such as pipelining, write buffering, caching, speculation, and out-of-order execution, are introduced to provide improved performance.

For general purpose PEs, such as ARM, these microarchitectural innovations are largely hidden from the programmer by a number of microarchitectural techniques. These techniques ensure that, within an individual PE, the behavior of the PE largely remains the same as the SEM. There are some exceptions to this where explicit synchronization is required. In the ARM architecture, these are limited to cases such as:

- Synchronization of changes to the instruction stream.
- Synchronization of changes to System registers.

In both these cases, the `ISB` instruction provides the necessary synchronization.

While the effect of ordering is largely hidden from the programmer within a single PE, the microarchitectural innovations have a profound impact on the ordering of memory accesses. Write buffering, speculation, and cache coherency protocols, in particular, can all mean that the order in which memory accesses occur, as seen by an external observer, differs significantly from the order of accesses that would appear in the SEM. This is usually invisible in a uniprocessor environment, but the effect becomes much more significant when multiple PEs are trying to communicate with memory. In reality, these effects are often only significant at particular synchronization boundaries between the different threads of execution.

The problems that arise from memory ordering considerations are sometimes described as the problem of *memory consistency*. Processor architectures have adopted one or more *memory consistency models*, or *memory models*, that describe the permitted limits of the memory re-ordering that can be performed by an implementation of the architecture. The comparison and categorization of these has generated significant research and comment in academic circles, and ARM recommends the *Memory Consistency Models for Shared Memory-Multiprocessors* paper as an excellent detailed treatment of this subject.

This appendix does not reproduce such a work, but instead concentrates on some cases that demonstrate the features of the weakly-ordered memory model of the ARM architecture from ARMv6. In particular, the examples show how the use of the `DMB` and `DSB` memory barrier instructions can provide the necessary safeguards to limit memory ordering effects at the required synchronization points.

## K10.1.2 Barrier operation definitions

The following reference, or provide, definitions of terms used in this appendix:

**DMB** See *Data Memory Barrier (DMB)* on page B2-87.

**DSB** See *Data Synchronization Barrier (DSB)* on page B2-88.

**ISB** See *Instruction Synchronization Barrier (ISB)* on page B2-87.

**Observer, Completion**

See *Observability and completion* on page B2-83.

**Program order**

The order of instructions as they appear in an assembly language program. This appendix does not attempt to describe or define the legal transformations from a program written in a higher level programming language, such as C or C++, into the machine language that can then be disassembled to give an equivalent assembly language program. Such transformations are a function of the semantics of the higher level language and the capabilities and options on the compiler.

### K10.1.3 Conventions

Many of the examples are written in a stylized extension to ARM assembler, to avoid confusing the examples with unnecessary code sequences.

**AArch32**

The construct `WAIT([Rx]==1)` describes the following sequence:

```
loop
    LDR R12, [Rx]
    CMP R12, #1
    BNE loop
```

Also, the construct `WAIT_ACQ([Rx]==1)` describes the following sequence:

```
   loop
    LDA R12, [Rx]       ; load acquire ensures it is ordered before subsequent loads/stores
    CMP R12, #1
    BNE loop
```

R12 is chosen as an arbitrary temporary register that is not in use. It is named to permit the generation of a false dependency to ensure ordering.

**AArch64**

The construct `WAIT([Xx]==1)` describes the following sequence:

```
loop
    LDR W12, [Xx]
    CMP W12, #1
    B.NE loop
```

Also, the construct `WAIT_ACQ([Xx]==1)` and describes the following sequence:

```
   loop
    LDAR W12, [Xx]       ; load acquire ensures it is ordered before subsequent loads/stores
    CMP W12, #1
    B.NE loop
```

For each example, a code sequence is preceded by an identifier of the observer running it:

- P0, P1…P*x* refer to caching coherent PEs that implement the ARMv8 architecture, and are in the same shareability domain.
- E0, E1…E*x* refer to non-caching observers, that do not participate in the coherency protocol, but execute ARM instructions and have a weakly-ordered memory model. This does not preclude these observers being different objects, such as DMA engines or other system masters.

These observers are unsynchronized other than as required by the documented code sequence.

**Note**

Throughout this appendix, *ARM instruction* and *instruction* refer to instructions from the A64, A32, or T32 instruction set, provided by ARMv8 implementations.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Results are expressed in terms of `<agent>:<register>`, such as `P0:R5`. The results can be described as:

**Permissible** This does not imply that the results expressed are required or are the only possible results. In most cases they are results that would not be possible under a sequentially consistent running of the code sequences on the agents involved. In general terms, this means that these results might be unexpected to anyone unfamiliar with memory consistency issues.

**Not permissible** Results that the architecture expressly forbids.

**Required** Results that the architecture expressly requires.

The examples omit the required shareability domain arguments of `DMB` and `DSB` instructions. The arguments are assumed to be selected appropriately for the shareability domains of the observers.

In AArch32 state, where the barrier function in the litmus test can be achieved by a `DMB ST`, that is a barrier to stores only, this is shown by the use of `DMB [ST]`. This indicates that the `ST` qualifier can be omitted without affecting the result of the test. In some implementations `DMB ST` is faster than `DMB`.

For AArch64 code, the shareability domain of the `DMB` or `DSB` must be included. This is shown in this manual using the notation `DMB <domain>` and `DSB <domain>` respectively.

Except where otherwise stated, other conventions are:

- All memory initializes to 0.
- R0 and W0 contain the value 1.
- R1 - R4 and W1 - W4 contain arbitrary independent addresses that initialize to the same value on all PEs. The addresses held in these registers are shareable and:
  - The addresses held in R1 and R2 are in Write-Back Cacheable Normal memory.
  - The address held in R3 is in Write-Through Cacheable Normal memory.
  - The address held in R4 is in Non-cacheable Normal memory.
- R5 - R8 and W5 - W8 contain:
  - When used with an `STR` instruction, `0x55`, `0x66`, `0x77`, and `0x88` respectively.
  - When used with an `LDR` instruction, the value 0.
- R11 and W11 contain a new instruction or new translation table entry, as appropriate, and R10 contains the virtual address and the ASID, for use in this change of translation table entry.
- Memory locations are Normal memory locations unless otherwise stated.

The examples use mnemonics for the cache maintenance and TLB maintenance instructions. The following tables describe the mnemonics:

- *Cache maintenance instructions, functional group* on page G4-4169.
- *TLB maintenance instructions, functional group* on page G4-4171.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K10.2 Load-Acquire, Store-Release and barriers

The Load-Acquire and Store-Release instructions are described in *Load-Acquire, Store-Release* on page B2-89.

The following sections show that most of the examples in sections *Simple ordering and barrier cases* on page K10-5633 and *Load-Exclusive, Store-Exclusive and barriers* on page K10-5639 can be achieved using the Load-Acquire and Store-Release instructions without the need for additional barriers.

### K10.2.1 Message passing

The following sections describe:

- *Resolving weakly-ordered message passing by using Acquire and Release*.
- *Resolving message passing by the use of Store-Release and address dependency* on page K10-5610.

#### Resolving weakly-ordered message passing by using Acquire and Release

The message passing problem described in *Weakly-ordered message passing problem* on page K10-5633 can be solved by the use of Load-Acquire and Store-Release instructions when accessing the communications flag:

**AArch32**

P1

```
STR R5, [R1]          ; sets new data
STL R0, [R2]          ; sends flag indicating data ready, which is ordered after the STR
```

P2

```
WAIT_ACQ([R2]==1)     ; waits on flag
LDR R5, [R1]
```

**AArch64**

P1

```
STR W5, [X1]          ; sets new data
STLR W0, [X2]         ; sends flag indicating data ready, which is ordered after the STR
```

P2

```
WAIT_ACQ([X2]==1)     ; waits on flag
LDR W5, [X1]
```

This ensures the observed order of both the reads and the writes allows transfer of data such that the result P2:R5==0x55 is guaranteed.

This approach also works with multiple observers, in a way that further observers use the same sequence as P2 uses:

**AArch32**

P3

```
WAIT_ACQ([R2]==1)     ; waits on flag
LDR R5, [R1]
```

**AArch64**

P3

```
WAIT_ACQ([X2]==1)     ; waits on flag
LDR W5, [X1]
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Resolving message passing by the use of Store-Release and address dependency

The lack of ordering of stores discussed in *Message passing with multiple observers* on page K10-5635 can be resolved by the use of Store-Release for the store of the valid flag by P1, even when the observers are using an address dependency:

**AArch32**

P1

```
STR R5, [R1]          ; sets new data
STL R0, [R2]          ; sends flag indicating data ready using a Store-Release
```

P2

```
WAIT([R2]==1)
AND R12, R12, #0      ; R12 is the destination of LDR in the WAIT macro
LDR R5, [R1, R12]     ; the load has an address dependency on R12
                      : and so is ordered after the flag has been seen
```

**AArch64**

P1

```
STR W5, [X1]          ; sets new data
STLR W0, [X2]         ; sends flag indicating data ready using a Store-Release
```

P2

```
WAIT([X2]==1)
AND W12, W12, WZR     ; W12 is the destination of LDR in the WAIT macro
LDR W5, [X1, X12]     ; the load has an address dependency on W12
                      : and so is ordered after the flag has been seen
```

This ensures the observed order of the writes allows transfer of data such that P2:R5 and P3:R5 contain the same value of `0x55`.

This approach also works with multiple observers, in a way that further observers use the same sequence as P2 uses:

**AArch32**

P3

```
WAIT([R2]==1)
AND R12, R12, #0      ; R12 is the destination of LDR in the WAIT macro
LDR R5, [R1, R12]     ; the load has an address dependency on R12
                      : and so is ordered after the flag has been seen
```

**AArch64**

P3

```
WAIT([X2]==1)
AND W12, W12, WZR     ; R12 is the destination of LDR in the WAIT macro
LDR W5, [X1, X12]     ; the load has an address dependency on W12
                      : and so is ordered after the flag has been seen
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### K10.2.2 Address dependency with object construction

When accessing an object-oriented data structure, the address dependency rule means that barriers are not required, even when initializing the object. A Store-Release can be used to ensure the order of the update of the base address:

**AArch32**

P1

```
STR R5, [R1, #offset] ; sets new data in a field
STL R1, [R2]          ; updates base address
```

P2

```
LDR R1, [R2]          ; reads base address
CMP R1, #0            ; checks if it is valid
BEQ null_trap
LDR R5, [R1, #offset] ; uses base address to read field
```

**AArch64**

P1

```
STR W5, [X1, #offset] ; sets new data in a field
STLR X1, [X2]         ; updates base address
```

P2

```
LDR X1, [X2]          ; reads base address
CMP X1, #0            ; check if it is valid
B.EQ null_trap
LDR W5, [X1, #offset] ; uses base address to read field
```

It is required that P2:R5==0x55 if the null_trap is not taken. This avoids P2 observing a partially constructed object from P1. Significantly, P2 does not need a barrier to ensure this behavior.

The read of the base address in P2 could be a Load-Acquire, but it is not necessary in this case.

### K10.2.3 Causal consistency issues with multiple observers

The cause consistent problem discussed in *Causal consistency issues with multiple observers* on page K10-5636 can be addressed by the use of a Store-Release, as this requires that the store is multicopy atomic in the case of a Load-Acquire. In addition, a Store-Release has an effect on the observation order of any stores observed by the observer executing the Store-Release.

The following sequences guarantee causal consistency:

- *Using multi-copy atomicity of the Store-Release when observed by Load-Acquire*.
- *Using ordering property of Store-Release on stores observed by the PE* on page K10-5612.

#### Using multi-copy atomicity of the Store-Release when observed by Load-Acquire

**AArch32**

P1

```
STL R0, [R2]          ; sets new data
                      ; this is made multi-copy atomic
```

P2

```
WAIT_ACQ([R2]==1)     ; waits to see new data from P1
STR R0, [R3]          ; sends flag
                      ; must be after the new data has been by P2,
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
                        ; as stores must not be speculative
                        ; this does not need to be a Store-Release,
                        ; though it could be a Store-Release
```

P3

```
    WAIT([R3]==1)       ; waits for P2 flag
                        ; this does not need to be a WAIT_ACQ, although
                        ; it could be a WAIT_ACQ (at which point the dependency is not needed)
    AND R12, R12, #0    ; dependency to ensure order (only needed for a WAIT, not WAIT_ACQ)
    ADD R12, R2, R12    ; creating a dependency
    LDA R0, [R12]       ; reads P1 data using a Load-Acquire
```

**AArch64**

P1

```
    STLR W0, [X2]       ; sets new data
                        ; this is made multi-copy atomic
```

P2

```
    WAIT_ACQ([X2]==1)   ; waits to see new data from P1
    STR W0, [X3]        ; sends flag
                        ; must be after the new data has been by P2 as stores
                        ; must not be speculative.
                        ; this does not need to be a Store-Release,
                        ; though it could be a Store-Release
```

P3

```
    WAIT([X3]==1)       ; waits for P2 flag
                        ; this does not need to be a WAIT_ACQ, though
                        ; it could be a WAIT_ACQ (at which point the dependency is not needed
    AND W12, W12, WZR   ; dependency to ensure order (only needed for a WAIT, not WAIT_ACQ)
    ADD X12, X2, X12    ; creating a dependency
    LDAR W0, [X12]      ; reads P1 data using a Load-Acquire
```

In this case, P3:R0 == 0 is not permissible. P3 is guaranteed to see the store from P1 if P2 has seen the store from P1 using a Load-Acquire.

### Using ordering property of Store-Release on stores observed by the PE

**AArch32**

P1

```
    STR R0, [R2]        ; sets new data
                        ; this does not have to be a Store-Release, though it
                        ; could be a Store-release
```

P2

```
    WAIT ([R2]==1)      ; waits to see new data from P1
                        ; this does not need to be a WAIT_ACQ, though it could be a WAIT_ACQ
    STL R0, [R3]        ; sends flag
                        ; this must be after the new data has been seen by P2
                        : as stores must not be speculative,
                        ; as a Store-Release, this orders the P1 store
```

P3

```
    WAIT([R3]==1)       ; waits for P2 flag
                        ; this does not need to be a WAIT_ACQ, although it could be a WAIT_ACQ
                        ; (at which point the dependency is not needed)
    AND R12, R12, #0    ; dependency to ensure order (only needed for a WAIT, not WAIT_ACQ)
    LDR R0, [R2, R12]   ; reads P1 data
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**AArch64**

P1

```
    STR W0, [X2]          ; sets new data
                          ; this does not have to be a Store-Release, though it
                          ; could be a Store-Release
```

P2

```
    WAIT ([X2]==1)        ; waits to see new data from P1
                          ; this does not need to be a WAIT_ACQ, though it could be a WAIT_ACQ
    STLR W0, [X3]         ; sends flag
                          ; this must be after the new data has been seen by P2
                          : as stores must not be speculative,
                          ; as a Store-Release, this orders the P1 store
```

P3

```
    WAIT([X3]==1)         ; waits for P2 flag
                          ; this does not need to be a WAIT_ACQ, though it could be a WAIT_ACQ
                          ; at which point the dependency is not needed
    AND W12, W12, WZR     ; dependency to ensure order
                          ; only needed for a WAIT, not WAIT_ACQ
    LDR W0, [X2, X12]     ; reads P1 data
```

In this case, P3:R0 == 0 is not permissible. P3 is guaranteed to see the store from P1 if P2 has seen the store from P1 before it does the Store-Release that is then seen by P3.

**Note**

The use of dependency by P3 could be replaced by a Load-Acquire.

### K10.2.4 Multiple observers of writes to multiple locations

The ARM weakly consistent memory model means that different observers can observe writes to different locations in different orders as was shown in *Multiple observers of writes to multiple locations* on page K10-5636, but the use of Load-Acquire and Store-Release can resolve this. In this case, the loads by P3 and P4 must be Load-Acquire in order to ensure the perceived multi-copy atomicity of the stores:

**AArch32**

P1

```
    STL R0, [R1]          ; sets new data
```

P2

```
    STL R0, [R2]          ; sets new data
```

P3

```
    LDA R10, [R2]         ; reads P2 data before P1
    LDA R9, [R1]          ;
    BIC R9, R10, R9       ; R9  <- R10 & ~R9
                          ; R9 contains 1 if read from [R2] is observed to be 1 and
                          ; read from [R1] is observed to be 0
```

P4

```
    LDA R9, [R1]
    LDA R10, [R2]
    BIC  R9, R9, R10      ; R9 <- R9 & ~R10
                          ; R9 contains 1 if read from [R2] is observed to be 0 and
                          ; read from [R1] is observed to be 1
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**AArch64**

P1

```
    STLR W0, [X1]         ; sets new data
```

P2

```
    STLR W0, [X2]         ; sets new data
```

P3

```
    LDAR W10, [X2]        ; reads P2 data before P1
    LDAR W9, [X1]         ;
    BIC W9, W10, W9       ; W9  <- W10 & ~W9
                          ; W9 contains 1 if read from [X2] is observed to be 1 and
                          ; read from [X1] is observed to be 0
```

P4

```
    LDAR W9, [X1]
    LDAR W10, [X2]
    BIC  W9, W9, W10      ; W9 <- W9 & ~W10
                          ; W9 contains 1 if read from [X2] is observed to be 0 and
                          ; read from [X1] is observed to be 1
```

In this case, the result P3:R9==1 and P4:R9==1 is not permissible, as the stores from P1 and P2 are multi-copy atomic when read by Load-Acquire.

Therefore, if P3 gets R10==1, then we know that the P3 load of R9 can only be observed after we know that P4 has also observed the P2 store to [R2]. Similarly, if the P4 load of R9 returns 1, and the P3 load of R9 returns 0, then the P3 load must have occurred before the P4 load.

Therefore, if the P3 load of R10 returns 1 and the P3 load of R9 returns 0, then we know that if the P4 load of R9 returns 1, it must have happened after P4 has observed the P2 store to [R2], so the P4 load of R10 must return 1.

This shows that, of the 4 possible values for {P3:R9, P4:R9}, the use of these instructions makes the result {1,1} impossible.

*Non-Confidential - Beta*

### K10.2.5 WFE and WFI and barriers

The Wait For Event and Wait For Interrupt instructions permit the PE to suspend execution and enter a low-power state. An explicit `DSB` barrier instruction is required if it is necessary to ensure memory accesses made before the `WFI` or `WFE` are visible to other observers, unless some other mechanism has ensured this visibility. Examples of other mechanism that would guarantee the required visibility are the `DMB` described in *Posting a store before polling for acknowledgement* on page K10-5638, or a dependency on a load.

The following example requires the `DSB` to ensure that the store is visible:

**AArch32**

P1

```
    STR R0, [R2]
    DSB
Loop
    WFI
    B Loop
```

**AArch64**

P1

```
    STR W0, [X2]
    DSB <domain>
Loop
    WFI
    B Loop
```

This requirement is unchanged in ARMv8 by the presence of Load-Acquire or Store-Release.

*Non-Confidential - Beta*

## K10.3 Load-Acquire Exclusive, Store-Release Exclusive and barriers

The ARMv8 architecture adds the acquire and release semantics to Load-Exclusive and Store-Exclusive instructions, which allows them to gain ordering acquire and/or release semantics.

The Load-Exclusive instruction can be specified to have acquire semantics, and the Store-Exclusive instruction can be specified to have release semantics. These can be arbitrarily combined to allow the atomic update created by a successful Load-Exclusive and Store-Exclusive pair to have any of:

- No Ordering semantics (using `LDREX` and `STREX`).
- Acquire only semantics (using `LDAEX` and `STREX`).
- Release only semantics (using `LDREX` and `STLEX`).
- Sequentially consistent semantics (using `LDAEX` and `STLEX`).

In addition, the ARMv8 specification requires that the clearing of a global monitor will generate an event for the PE associated with the global monitor, which can simplify the use of `WFE`, by removing the need for a `DSB` barrier and `SEV` instruction.

### K10.3.1 Acquiring a lock

A common use of Load-Exclusive and Store-Exclusive instructions is to claim a lock to permit entry into a critical region. This is typically performed by testing a lock variable that indicates 0 for a free lock and some other value, commonly 1 or an identifier of the process holding the lock, for a taken lock.

For a critical region, the requirement on taking a lock is usually for acquire semantics, while the clearing of a lock requires release semantics:

**AArch32**

Px

```
    PLDW[R1]              ; preload into cache in unique state
Loop
    LDAEX R5, [R1]        ; read lock with acquire
    CMP R5, #0            ; check if 0
    STREXEQ R5, R0, [R1]  ; attempt to store new value
    CMPEQ R5, #0          ; test if store suceeded
    BNE Loop              ; retry if not

    ; loads and stores in the critical region can now be performed
```

**AArch64**

Px

```
    PRFM PSTL1KEEP, [X1]  ; preload into cache in unique state
Loop
    LDAXR W5, [X1]        ; read lock with acquire
    CBNZ W5, Loop         ; check if 0
    STXR W5, W0, [X1]     ; attempt to store new value
    CBNZ W5, Loop         ; test if store succeeded and retry if not

    ; loads and stores in the critical region can now be performed
```

The acquire associated with the load is sufficient to ensure the required ordering in a lock situation. The Store-Exclusive will fail (and so be retried) if there is a store to the location being monitored between the Load-Exclusive and the Store-Exclusive.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### K10.3.2 Releasing a lock

The converse operation of releasing a lock does not require the use of Load-Exclusive and Store-Exclusive instructions, because only a single observer is able to write to the lock. However, often it is necessary for any observer to observe any memory updates, or any values that are loaded into memory, before they observe the release of the lock. Therefore, the lock release needs release semantics:

**AArch32**

Px

```
    ; loads and stores in the critical region
    MOV R0, #0
    STL R0, [R1]          ; clear the lock with release semantics
```

**AArch64**

Px

```
    ; loads and stores in the critical region
    STLR WZR, [X1]        ; clear the lock with release semantics
```

### K10.3.3 Ticket locks

When a lock is free, in order to avoid a rush to get the lock by many PEs, the use of ticket locks is common in more advanced systems. When the use is requested, the ticket locks determine the order of the users of the critical sections, in order to avoid starvation that can occur with a simple contention based spin lock.

A ticket lock allocates each thread a ticket number when it first requests the lock, and then compares that number with the current number for the lock. If they are the same, then the critical section can be entered. Otherwise the thread waits until the current number is equal to the ticket number for that thread.

The reading of the current number of the lock needs acquire semantics for the lock to be acquired.

**Note**

The code in this section is little-endian code, as it views the combined current and next values as a single combined quantity. The addresses of the current and next ticket values need to be adjusted for a big-endian system.

This is shown in the implementation below:

**AArch32**

Px

```
    ; R1 holds two 16 bit quantities
    ; the lower halfword holds the current ticket number
    ; the higher halfword holds the next ticket number

    PLDW[R1]              ; preload into cache in unique state
Loop1
    LDAEX R5, [R1]        ; read current and next
    ADD R5, R5, #0x10000  ; increment the next number
    STREX R6, R5, [R1]    ; and update the value
    CMP R6, #0            ; did the exclusive pass
    BNE Loop1             ; retry if not
    CMP R5, R5, ROR #16   ; is the current ticket ours
    BEQ block_start
Loop2
    LDAH R6, [R1]         ; read current value
    CMP R6, R5, LSR #16   ; compare it with our allocated ticket
    BNE Loop2             ; retry (spin) if it is not the same
block_start
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**AArch64**

Px

```
    ; X1 holds 2 16 bit quantities
    ; the lower halfword holds the current ticket number
    ; the higher halfword holds the next ticket number

    PRFM PSTL1KEEP, [X1]  ; preload into cache in unique state
Loop1
    LDAXR W5, [X1]        ; read current and next
    ADD W5, W5, #0x10000  ; increment the next number
    STXR W6, W5, [X1]     ; and update the value
    CBNZ W6, Loop1        ; did the exclusive pass - retry if not

    AND W6, W5, #0xFFFF
    CMP W6, W5, LSR #16   ; is the current ticket ours
    B.EQ block_start
Loop2
    LDARH W6, [X1]        ; read current value
    CMP W6, W5, LSR #16   ; compare it with the our allocated ticket
    B.NE Loop2            ; retry (spin) if it isn't the same
block_start
```

Releasing the ticket lock simply involves incrementing the current ticket number, that is still assumed to be in R3, and doing a Store-Release:

**AArch32**

```
    ADD R6, R6, #1
    STLH R6, [R1]
```

**AArch64**

```
    ADD W6, W6, #1
    STLRH W6, [X1]
```

### K10.3.4 Use of Wait For Event (WFE) and Send Event (SEV) with locks

The ARMv8 architecture can use the Wait For Event mechanism to minimise the energy cost of polling variables by putting the PE into a low power state, suspending execution, until an asynchronous exception or an explicit event is seen by that PE. In ARMv8, the event can be generated as a result of clearing the global monitor, so removing the need for a `DSB` barrier or an explicit send event message.

This can be used with simple locks or with ticket locks.

#### Simple lock

The following is an example of lock acquire code using `WFE`:

**AArch32**

Px

```
    PLDW[R1]              ; preload into cache in unique state
Loop
    LDAEX R5, [R1]        ; read lock with acquire
    CMP R5, #0            ; check if 0
    WFENE                 ; sleep if the lock is held
    STREXEQ R5, R0, [R1]  ; attempt to store new value
    CMPEQ R5, #0          ; test if store succeeded
    BNE Loop              ; retry if not
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**AArch64**

Px

```
    SEVL                ; invalidates the WFE on the first loop iteration
    PRFM PSTL1KEEP, [X1]  ; allocate into cache in unique state
Loop
    WFE
    LDAXR W5, [X1]        ; read lock with acquire
    CBNZ W5, Loop         ; check if 0
    STXR W5, W0, [X1]     ; attempt to store new value
    CBNZ W5, Loop         ; test if store succeeded and retry if not

    ; loads and stores in the critical region can now be performed
```

And the following is an example of lock release code:

**AArch32**

Px

```
    ; loads and stores in the critical region
    MOV R0, #0
    STL R0, [R1]          ; clear the lock
```

**AArch64**

Px

```
    ; loads and stores in the critical region
    STLR WZR, [X1]        ; clear the lock
```

## Ticket lock

In the Ticket lock case, the Load-Exclusive instruction can be used to move the monitor into the exclusive state for the express purpose of creating an event when the monitor changes state:

**AArch32**

Px

```
    ; R1 holds 2 16 bit quantities
    ; the lower halfword holds the current ticket number
    ; the higher halfword holds the next ticket number

    PLDW[R1]              ; preload into cache in unique state
Loop1
    LDAEX R5, [R1]        ; read current and next
    ADD R5, R5, #0x10000  ; increment the next number
    STREX R6, R5, [R1]    ; and update the value
    CMP R6, #0            ; did the exclusive pass
    BNE Loop              ; retry if not
    CMP R5, R5, ROR #16   ; is the current ticket ours
    BEQ block_start
    SEVL
Loop2
    WFE                   ; wait if there has not been a change to the count since last
                          ; read
    LDAEXH R6, [R1]       ; check the current count
    CMP R6, R5, LSR #16   ; check if it is equal
    BNE Loop2
block_start
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**AArch64**

Px

```
    ; X1 holds 2 16 bit quantities
    ; the lower halfword holds the current ticket number
    ; the higher halfword holds the next ticket number

    PRFM PSTL1KEEP, [X1]  ; preload into cache in unique state
Loop1
    LDAXR W5, [X1]        ; read current and next
    ADD W5, W5, #0x10000  ; increment the next number
    STXR W6, W5, [X1]     ; and update the value
    CBNZ W6, Loop1        ; did the exclusive pass - retry if not

    AND W6, W5, 0xFFFF
    CMP W6, W5, LSR #16   ; is the current ticket ours
    B.EQ block_start
    SEVL
Loop2
    WFE
    LDAXRH W6, [X1]       ; read current value
    CMP W6, W5, LSR #16   ; compare it with our allocated ticket
    B.NE Loop2            ; retry (spin) if it is not the same
block_start
```

## K10.4 Using a mailbox to send an interrupt

In some message passing systems, it is common for one observer to update memory and then notify a second observer of the update by sending an interrupt, using a mailbox.

Although a memory access might be made to initiate the sending of the mailbox interrupt, a `DSB` instruction is required to ensure the completion of previous memory accesses.

Therefore, the following sequence is required to ensure that P2 observes the updated value:

**AArch32**

P1

```
STR R5, [R1]          ; message stored to shared memory location
DSB ST
STR R0, [R4]          ; R4 contains the address of a mailbox
```

P2

```
; interrupt service routine
LDR R5, [R1]
```

**AArch64**

P1

```
STR W5, [X1]          ; message stored to shared memory location
DSB ST
STR W0, [X4]          ; R4 contains the address of a mailbox
```

P2

```
; interrupt service routine
LDR W5, [X1]
```

## K10.5 Cache and TLB maintenance instructions and barriers

The following sections describe the use of barriers with cache and TLB maintenance instructions:

- *Data cache maintenance instructions*.
- *Instruction cache maintenance instructions* on page K10-5626.
- *TLB maintenance instructions and barriers* on page K10-5629.

### K10.5.1 Data cache maintenance instructions

The following sections describe the use of barriers with data cache maintenance instructions:

- *Message passing to non-caching observers*.
- *Multiprocessing message passing to non-caching observers* on page K10-5623.
- *Invalidating DMA buffers, non-functional example* on page K10-5624.
- *Invalidating DMA buffers, functional example with single PE* on page K10-5624.
- *Invalidating DMA buffers, functional example with multiple coherent PEs* on page K10-5625.

#### Message passing to non-caching observers

The ARMv8 architecture requires the use of `DMB` instructions to ensure the ordering of data cache maintenance instructions and their effects. The Load-Acquire and Store-Release instructions have no effect on cache maintenance instruction. This means the following message passing approaches can be used when communicating between caching observers and non-caching observers:

**AArch32**

P1

```
STR R5, [R1]          ; updates data (assumed to be in P1 cache)
DCCMVAC R1            ; cleans cache to point of coherency
DMB                   ; ensures effects of the clean will be observed before the
                      ; flag is set
STR R0, [R4]          ; sends flag to external agent (Non-cacheable location)
```

E1

```
WAIT_ACQ ([R4] == 1)  ; waits for the flag (with order)
LDR R5, [R1]          ; reads the data
```

**AArch64**

P1

```
STR W5, [X1]          ; updates data (assumed to be in P1 cache)
DC CVAC, X1           ; cleans cache to point of coherency
DMB ISH               ; ensures effects of the clean will be observed before the
                      ; flag is set
STR W0, [X4]          ; sends flag to external agent (Non-cacheable location)
```

E1

```
WAIT_ACQ ([X4] == 1)  ; waits for the flag (with order)
LDR W5, [X1]          ; reads the data
```

In this example, it is required that E1:R5==`0x55`.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### Multiprocessing message passing to non-caching observers

The broadcast nature of the cache maintenance instructions combined with properties of barriers, means that the message passing principle for non-caching observers is:

**AArch32**

P1

```
STR R5, [R1]          ; updates data (assumed to be in P1 cache)
STL R0, [R2]          ; sends a flag for P2 (ordered by the store release)
```

P2

```
WAIT ([R2] == 1)      ; waits for P1 flag
DMB                   ; ensures cache clean is observed after P1 flag is observed
DCCMVAC R1            ; cleans cache to point of coherency - will clean P1 cache
DMB                   ; ensures effects of the clean will be observed before the
                      ; flag to E1 is set
STR R0, [R4]          ; sends flag to E1
```

E1

```
WAIT_ACQ ([R4] == 1)      ; waits for P2 flag (ordered)
LDR R5, [R1]              ; reads data
```

**AArch64**

P1

```
STR W5, [X1]          ; updates data (assumed to be in P1 cache)
STLR W0, [X2]         ; sends a flag for P2 (ordered)
```

P2

```
WAIT ([X2] == 1)      ; waits sfor P1 flag
DMB SY                ; ensure cache clean is observed after P1 flag is observed
DC CVAC, X1           ; cleans cache to point of coherency, will clean P1 cache
DMB SY                ; ensures effects of the clean will be observed before the
                      ; flag to E1 is set
STR W0, [X4]          ; sends flag to E1
```

E1

```
WAIT_ACQ ([X4] == 1)      ; waits for P2 flag
LDR W5, [X1]              ; reads data
```

In this example, it is required that E1:R5==`0x55`. The clean operation executed by P2 affects the data location in the P1 cache. The cast-out from the P1 cache is guaranteed to be observed before P2 updates [R4].

**Note**

The cache maintenance instructions are not ordered by the Load-Acquire and Store-Release instructions.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### Invalidating DMA buffers, non-functional example

The basic scheme for communicating with an external observer that is a process that passes data in to a Cacheable memory region must take account of the architectural requirement that regions marked as Cacheable can be allocated into a cache at any time, for example as a result of speculation. The following example shows this possibility:

**AArch32**

P1

```
    DCIMVAC R1            ; ensures cache is not dirty. A clean operation could be used
                          ; but as the DMA will subsequently overwrite this region an
                          ; invalidate operation is sufficient and usually more efficient
    DMB                   ; ensures cache invalidation is observed before the next store
                          ; is observed
    STR R0, [R3]          ; sends flag to external agent
    WAIT_ACQ ([R4]==1)    ; waits for a different flag from an external agent
    LDR R5, [R1]
```

E1

```
    WAIT ([R3] == 1)      ; waits for flag
    STR R5, [R1]          ; stores new data
    STL R0, [R4]          ; sends a flag
```

**AArch64**

P1

```
    DC IVAC, X1           ; ensure cache is not dirty. A clean operation could be used
                          ; but as the DMA will subsequently overwrite this region an
                          ; invalidate operation is sufficient and usually more efficient
    DMB SY                ; ensures cache invalidation is observed before the next store
                          ; is observed
    STR W0, [X3]          ; sends flag to external agent
    WAIT_ACQ ([X4]==1)    ; waits for a different flag from an external agent
    LDR W5, [X1]
```

E1

```
    WAIT ([X3] == 1)      ; waits for flag
    STR W5, [X1]          ; stores new data
    STLR W0, [X4]         ; sends a flag
```

If a speculative access occurs, there is no guarantee that the cache line containing [R1] is not brought back into the cache after the cache invalidation, but before [R1] is written by E1. Therefore, the result P1:R5=0 is permissible.

### Invalidating DMA buffers, functional example with single PE

**AArch32**

P1

```
    DCIMVAC R1            ; ensures cache is not dirty. A clean operation could be used
                          ; but as the DMA will subsequently overwrite this region an
                          ; invalidate operation is sufficient and usually more efficient
    DMB                   ; ensures cache invalidation is observed before the next store
                          ; is observed
    STR R0, [R3]          ; sends flag to external agent
    WAIT ([R4]==1)        ; waits for a different flag from an external agent
    DMB                   ; ensures that cache invalidate is observed after the flag
                          ; from external agent is observed
    DCIMVAC R1            ; ensures cache discards stale copies before use
    LDR R5, [R1]
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

E1

```
WAIT ([R3] == 1)      ; waits for flag

STR R5, [R1]          ; stores new data

STL R0, [R4]          ; sends a flag
```

**AArch64**

P1

```
DC IVAC, X1           ; ensures cache is not dirty. A clean operation could be used
                      ; but as the DMA will subsequently overwrite this region an
                      ; invalidate operation is sufficient and usually more efficient
DMB SY                ; ensures cache invalidation is observed before the next store
                      ; is observed
STR W0, [X3]          ; sends flag to external agent
WAIT ([X4]==1)        ; waits for a different flag from an external agent
DMB SY                ; ensures that cache invalidate is observed after the flag
                      ; from external agent is observed
DC IVAC, X1           ; ensures cache discards stale copies before use
LDR W5, [X1]
```

E1

```
WAIT ([X3] == 1)      ; waits for flag
STR W5, [X1]          ; stores new data
STLR W0, [X4]         ; sends a flag
```

In this example, the result P1:R5 == `0x55` is required. Including a cache invalidation after the store by E1 to [R1] is observed ensures that the line is fetched from external memory after it has been updated.

### Invalidating DMA buffers, functional example with multiple coherent PEs

The broadcasting of cache maintenance instructions, and the use of `DMB` instructions to ensure their observability, means that the previous example extends naturally to a multiprocessor system. Typically this requires a transfer of ownership of the region that the external observer is updating.

**AArch32**

P0

```
(Use data from [R1], potentially using [R1] as scratch space)
STL R0, [R2]          ; signals release of [R1]
WAIT_ACQ ([R2] == 0)  ; waits for new value from DMA
LDR R5, [R1]
```

P1

```
WAIT ([R2] == 1)      ; waits for release of [R1] by P0
DCIMVAC R1            ; ensures caches are not dirty, an invalidate is sufficient
DMB
STR R0, [R3]          ; requests new data for [R1]
WAIT ([R4] == 1)      ; waits for new data
DMB
DCIMVAC R1            ; ensures caches discard stale copies before use
DMB
MOV R0, #0
STR R0, [R2]          ; signals availability of new [R1]
```

E1

```
WAIT ([R3] == 1)      ; waits for new data request
STR R5, [R1]          ; sends new [R1]
DMB [ST]
STR R0, [R4]          ; indicates that new data is available to P1
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**AArch64**

P0

```
(Use data from [X1], potentially using [X1] as scratch space)
STLR W0, [X2]         ; signals release of [X1]
WAIT_ACQ ([X2] == 0)  ; waits for new value from DMA
LDR W5, [X1]
```

P1

```
WAIT ([X2] == 1)      ; waits for release of [R1] by P0
DC IVAC, X1           ; ensures caches are not dirty, an invalidate is sufficient
DMB SY
STR W0, [X3]          ; requests new data for [R1]
WAIT ([X4] == 1)      ; waits for new data
DMB SY
DCIMVAC X1            ; ensures caches discard stale copies before use
DMB SY
STR WZR, [X2]         ; signals availability of new [R1]
```

E1

```
WAIT ([X3] == 1)      ; waits for new data request
STR W5, [X1]          ; sends new [R1]
STR W0, [X4]          ; indicates new data is available to P1
```

In this example, the result P0:R5 == `0x55` is required. The `DMB` issued by P1 after the first data cache invalidation ensures that effect of the cache invalidation on P0 is seen by E1 before the store by E1 to [R1]. The `DMB` issued by P1 after the second data cache invalidation ensures that its effects are seen before the store of 0 to the semaphore location in [R2].

## K10.5.2 Instruction cache maintenance instructions

The following sections describe the use of barriers with instruction cache maintenance instructions:

- *Ensuring the visibility of updates to instructions for a uniprocessor*.
- *Ensuring the visibility of updates to instructions for a multiprocessor* on page K10-5627.

### Ensuring the visibility of updates to instructions for a uniprocessor

On a single PE, the agent that causes instruction fetches, or instruction cache linefills, is a separate memory system observer from the agent that causes data accesses. Therefore, any operations to invalidate the instruction cache can rely only on seeing updates to memory that are complete. This must be ensured by the use of a `DSB` instruction.

Also, instruction cache maintenance instructions are only guaranteed to complete after the execution of a `DSB`, and an `ISB` is required to discard any instructions that might have been prefetched before the instruction cache invalidation completed. Therefore, on a uniprocessor, to ensure the visibility of an update to code and to branch to it, the following sequence is required:

**AArch32**

P1

```
STR R11, [R1]         ; R11 contains a new instruction to be stored in program memory
DCCMVAU R1            ; clean to PoU makes the new instruction visible to the instruction cache
DSB
ICIMVAU R1            ; ensures instruction cache/branch predictor discards stale data
BPIMVA R1
DSB                   ; ensures completion of the invalidation
ISB                   ; ensures instruction fetch path sees new instruction cache state
BX R1
```

In AArch64, the branch predictor maintenance is not required.

**AArch64**

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

P1

```
STR W11, [X1]         ; W11 contains a new instruction to be stored in program memory
DC CVAU, X1           ; clean to PoU makes the new instruction visible to instruction cache
DSB ISH
IC IVAU, X1           ; ensures instruction cache/branch predictor discards stale data
DSB ISH               ; ensures completion of the invalidation
ISB                   ; ensures instruction fetch path sees new instruction cache state
BR X1
```

**Note**

Where the changes to the instructions span multiple cache lines, then the data cache and instruction cache maintenance instructions can be duplicated to cover each of the lines to be cleaned and to be invalidated.

### Ensuring the visibility of updates to instructions for a multiprocessor

The ARMv8 architecture requires a PE that executes an instruction cache maintenance instruction to execute a `DSB` instruction to ensure completion of the maintenance operation. This ensures that the cache maintenance instruction is complete on all PEs in the Inner Shareable shareability domain.

An `ISB` is not broadcast, and so does not affect other PEs. This means that any other PE must perform its own `ISB` synchronization after it knows that the update is visible, if it is necessary to ensure its synchronization with the update. The following example shows how this might be done:

**AArch32**

P1

```
STR R11, [R1]         ; R11 contains a new instruction to be stored in program memory
DCCMVAU R1            ; clean to PoU makes the new instruction visible to the instruction cache
DSB                   ; ensures completion of the clean on all PEs
ICIMVAU R1            ; ensures instruction cache discards stale data
BPIMVA R              ; ensures branch predictor discards stale data
DSB                   ; ensures completion of the instruction cache and branch predictor
                      ; invalidation on all PEs
STR R0, [R2]          ; sets flag to signal completion
ISB                   ; synchronizes context on this PE
BX R1                 ; branches to new code
```

P2-P*x*

```
WAIT ([R2] == 1)      ; waits for flag signalling completion
ISB                   ; synchronizes context on this PE
BX R1                 ; branches to new code
```

**AArch64**

P1

```
STR X11, [X1]         ; X11 contains a new instruction to be stored in program memory
DC CVAU, X1           ; clean to PoU makes the new instruction visible to the instruction cache
DSB ISH               ; ensures completion of the clean on all PEs
IC IVAU, X1           ; ensures instruction cache/branch predictor discards stale data
DSB ISH               ; ensures completion of the instruction cache/branch predictor
                      ; invalidation on all PEs
STR W0, [X2]          ; sets flag to signal completion
ISB                   ; synchronizes context on this PE
BR R1                 ; branches to new code
```

P2-P*x*

```
WAIT ([X2] == 1)      ; waits for flag signalling completion
ISB                   ; synchronizes context on this PE
BR X1                 ; branches to new code
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### *Nonfunctional approach*

The following sequence does not have the same effect, because a DSB is not required to complete the instruction cache maintenance instructions that other PEs issue:

**AArch32**

P1

```
STR R11, [R1]          ; R11 contains a new instruction to be stored in program memory
DCCMVAU R1             ; clean to PoU makes the new instruction visible to the instruction cache
DSB                    ; ensures completion of the clean on all PEs
ICIMVAU R1             ; ensures instruction cache discards stale data
BPIMVA R1              : ensures branch predictor discards stale data
DMB                    ; ensures ordering of the store after the invalidation
                       ; DOES NOT guarantee completion of instruction cache/branch
                       ; predictor on other PEs
STR R0, [R2]           ; sets flag to signal completion
DSB                    ; ensures completion of the invalidation on all PEs
ISB                    ; synchronizes context on this PE
BX R1                  ; branches to new code
```

P2-P*x*

```
WAIT ([R2] == 1)       ; waits for flag signalling completion
DSB                    ; this DSB does not guarantee completion of P1
                       ; ICIMVAU/BPIMVA
ISB
BX R1
```

**AArch64**

P1

```
STR W11, [X1]          ; W11 contains a new instruction to be stored in program memory
DC CVAU, X1            ; clean to PoU makes the new instruction visible to instruction cache
DSB ISH                ; ensures completion of the clean on all PEs
IC IVAU, X1            ; ensures instruction cache/branch predictor discards stale data
DMB ISH                ; ensures ordering of the store after the invalidation
                       ; DOES NOT guarantee completion of instruction cache/branch
                       ; predictor on other PEs
STR W0, [X2]           ; sets flag to signal completion
DSB ISH                ; ensures completion of the invalidation on all PEs
ISB                    ; synchronizes context on this PE
BR X1                  ; branches to new code
```

P2-P*x*

```
WAIT ([X2] == 1)       ; waits for flag signalling completion
DSB ISH                ; this DSB does not guarantee completion of P1
                       ; ICIMVAU/BPIMVA
ISB
BR X1
```

In this example, P2…P*x* might not see the updated region of code at R1.

### K10.5.3 TLB maintenance instructions and barriers

The following sections describe the use of barriers with TLB maintenance instructions:

- *Ensuring the visibility of updates to translation tables for a uniprocessor*.
- *Ensuring the visibility of updates to translation tables for a multiprocessor* on page K10-5630.
- *Paging memory in and out* on page K10-5630.

#### Ensuring the visibility of updates to translation tables for a uniprocessor

On a single PE, the agent that causes translation table walks is a separate memory system observer from the agent that causes data accesses. Therefore, any operations to invalidate the TLB can only rely on seeing updates to memory that are complete. This must be ensured by the use of a `DSB` instruction.

The ARMv8 architecture requires that translation table walks look in the data or unified caches at L1, so such systems do not require data cache cleaning.

After the translation tables update, any old copies of entries that might be held in the TLBs must be invalidated. This operation is only guaranteed to affect all instructions, including instruction fetches and data accesses, after the execution of a `DSB` and an `ISB`. Therefore, the code for updating a translation table entry is:

**AArch32**

P1

```
STR R11, [R1]         ; updates the translation table entry
DSB                   ; ensures visibility of the update to translation table walks
TLBIMVA R10
BPIALL
DSB                   ; ensures completion of the BP and TLB invalidation
ISB                   ; synchronises context on this PE
; new translation table entry can be relied upon at this point and all accesses
; generated by this observer using
; the old mapping have been completed
```

**AArch64**

P1

```
STR X11, [X1]         ; updates the translation table entry
DSB ISH               ; ensures visibility of the update to translation table walks
TLBI VAE1, X10        ; assumes we are in the EL1
DSB ISH               ; ensures completion of the TLB invalidation
ISB                   ; synchronise context on this PE
; new translation table entry can be relied upon at this point and all accesses
; generated by this observer using
; the old mapping have been completed
```

Importantly, by the end of this sequence, all accesses that used the old translation table mappings have been observed by all observers.

An example of this is where a translation table entry is marked as invalid. Such a system must provide a mechanism to ensure that any access to a region of memory being marked as invalid has completed before any action is taken as a result of the region being marked as invalid.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### Ensuring the visibility of updates to translation tables for a multiprocessor

The same code sequence can be used in a multiprocessing system. The ARMv8 architecture requires a PE that executes a TLB maintenance instruction to execute a `DSB` instruction to ensure completion of the maintenance operation. This ensures that the TLB maintenance instruction is complete on all PEs in the Inner Shareable shareability domain.

The completion of a `DSB` that completes a TLB maintenance instruction ensures that all accesses that used the old mapping have completed.

**AArch32**

P1

```
STR R11, [R1]         ; updates the translation table entry
DSB                   ; ensures visibility of the update to translation table walks
TLBIMVAIS R10
BPIALLIS
DSB                   ; ensures completion of the BP and TLB invalidation
ISB                   ; Note ISB is not broadcast and must be executed locally
                      ; on other PEs
;  new translation table entry can be relied upon at this point and all accesses
;  generated by any observers affected by the broadcast TLBIMVAIS operation using
;  the old mapping have been completed
```

**AArch64**

P1

```
STR X11, [X1]         ; updates the translation table entry
DSB ISH               ; ensures visibility of the update to translation table walks
TLBI VAE1IS,  X10
DSB ISH               ; ensures completion of the TLB invalidation
ISB                   ; Note ISB is not broadcast and must be executed locally
                      ; on other PEs
;  new translation table entry can be relied upon at this point and all accesses
;  generated by any observers affected by the broadcast TLBIMVAIS operation using
;  the old mapping have been completed
```

The completion of the TLB maintenance instruction is guaranteed only by the execution of a `DSB` by the observer that performed the TLB maintenance instruction. The execution of a `DSB` by a different observer does not have this effect, even if the `DSB` is known to be executed after the TLB maintenance instruction is observed by that different observer.

### Paging memory in and out

In a multiprocessor system there is a requirement to ensure the visibility of translation table updates when paging regions of memory into RAM from a backing store. This might, or might not, also involve paging existing locations in memory from RAM to a backing store. In such situations, the operating system selects one or more pages of memory that might be in use but are suitable to discard, with or without copying to a backing store, depending on whether or not the region of memory is writable. Disabling the translation table mappings for a page, and ensuring the visibility of that update to the translation tables, prevents agents accessing the page.

For this reason, it is important that the `DSB` that is performed after the TLB invalidation ensures that no other updates to memory using those mappings are possible.

An example sequence for the paging out of an updated region of memory, and the subsequent paging in of memory, is as follows:

**AArch32**

P1

```
STR R11, [R1]         ; updates the translation table for the region being paged out
DSB                   ; ensures visibility of the update to translation table walks
TLBIMVAIS R10         ; invalidates the old entry
DSB                   ; ensures completion of the invalidation on all PEs
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

```
ISB                  ; ensures visibility of the invalidation
BL SaveMemoryPageToBackingStore
BL LoadMemoryFromBackingStore
DSB                  ; ensures completion of the memory transfer (this could be part of
                     ; LoadMemoryFromBackingStore
ICIALLUIS            ; also invalidates the branch predictor
STR R9, [R1]         ; creates a new translation table entry with a new mapping
DSB                  ; ensures completion of the instruction cache
                     ; and branch predictor invalidation
                     ; AND ensures visibility of the new translation table mapping
ISB                  ; ensures synchronisation of this instruction stream
```

**AArch64**

P1

```
STR X11, [X1]        ; updates the translation table for the region being paged out
DSB ISH              ; ensures visibility of the update to translation table walks
TLBI VAE1IS, X10     ; invalidates the old entry
DSB ISH              ; ensures completion of the invalidation on all PEs
ISB                  ; ensures visibility of the invalidation
BL SaveMemoryPageToBackingStore
BL LoadMemoryFromBackingStore
DSB ISH              ; ensures completion of the memory transfer (this could be part of
                     ; LoadMemoryFromBackingStore
IC IALLUIS           ; also invalidates the branch predictor
STR X9, [X1]         ; creates a new translation table entry with a new mapping
DSB ISH              ; ensures completion of the instruction cache
                     ; and branch predictor invalidation
                     ; AND ensures visibility of the new translation table mapping
ISB                  ; ensures synchronisation of this instruction stream
```

This example assumes the memory copies are performed by an observer that is coherent with the caches of PE P1. This observer might be P1 itself, using a specific paging mapping. For clarity, the example omits the functional descriptions of `SaveMemoryPageToBackingStore` and `LoadMemoryFromBackingStore`. `LoadMemoryFromBackingStore` is required to ensure that the memory updates that it makes are visible to instruction fetches.

In this example, the use of ICIALLUIS in AArch32 and IC IALLUIS in AArch64 to invalidate the entire instruction cache is a simplification, that might not be optimal for performance. An alternative approach involves invalidating all of the lines in the caches using ICIMVAU and IC IVAU operations in AArch32 and AArch64 respectively. This invalidation must be done when the mapping used for the ICIMVAU and IC IVAU operations is valid but not executable.

### K10.5.4 Ordering of Memory-mapped device control with payloads

With a Memory-mapped peripheral, such as a DMA, which can also access memory for its own use, it is common to have control or status registers which are Memory-mapped. These registers need to be accessed in an ordered manner with respect to the data that the Memory-mapped peripheral is handling.

Two simple examples of this are:

- When a processing element is writing a buffer of data, and then writing to a control register in the DMA peripheral to start that peripheral to access the buffer of data.
- When a DMA peripheral has written to a buffer of data in memory, and the processing element is reading a status register to determine that the DMA transfer has completed, and then is reading the data.

For the case of the processing element writing a buffer of data, before starting the DMA peripheral, the ordering requirements between the stores to the data buffer and the stores to the Memory-mapped a to the DMA peripheral can be met by the insertion of a `DSB <domain>` instruction between these sets of accesses as this ensures the global observation of the stores before the DMA is started. this is shown by the following code:

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**AArch32**

P1

```
STR R5, [R2]          ; data written to the data buffer

DSB

STR R0, [R4]          ; R4 contains the address of the DMA control register
```

**AArch64**

P1

```
STR W5, [X2]          ; data written to the data buffer
DSB <domain>
STR W0, [X4]          ; X4 contains the address of the DMA control register
```

For the case of DMA peripheral writing the data buffer and then setting a status register when those stores are complete (and so globally observed) and then having this status register polled by the processing element before the processing element reads the data buffer, the processing element must insert a `DSB <domain>` between the load that reads the status register, and the read of the buffer. A DMB, or load-acquire, is not sufficient as this problem is not solely concerned with observation order, since the polling read is actually a read of a status register at a slave, not the polling a data value that has been written by an observer.

For this case, the code is therefore:

**AArch32**

P1

```
WAIT ([R4] == 1)      ; R4 contains the address of the status register,
                      ; and the value '1' indicates completion of the DMA transfer
DSB
LDR R5, [R2]          ; reads data from the data buffer
```

**AArch64**

P1

```
WAIT ([X4] == 1)      ; X4 contains the address of the status register,
                      ; and the value '1' indicates completion of the DMA transfer
DSB <domain>
LDR W5, [X2]          ; reads data from the data buffer
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K10.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

The following sections describe the ARMv7 compatible approaches for ordering, using DMB and DSB barriers:

- *Simple ordering and barrier cases*.
- *Load-Exclusive, Store-Exclusive and barriers* on page K10-5639.
- *Using a mailbox to send an interrupt* on page K10-5641.
- *Cache and TLB maintenance instructions and barriers* on page K10-5641.

### K10.6.1 Simple ordering and barrier cases

ARM implements a weakly consistent memory model for Normal memory. In general terms, this means that the order of memory accesses observed by other observers might not be the order that appears in the program, for either loads or stores.

This section includes examples of this.

#### Simple weakly consistent ordering example

P1

```
STR R5, [R1]
LDR R6, [R2]
```

P2

```
STR R6, [R2]
LDR R5, [R1]
```

In the absence of barriers, the result of P1: R6=0, P2: R5=0 is permissible.

#### Message passing

The following sections describe:

- *Weakly-ordered message passing problem*.
- *Message passing with multiple observers* on page K10-5635.

##### *Weakly-ordered message passing problem*

P1

```
STR R5, [R1]            ; sets new data
STR R0, [R2]            ; sends flag indicating data ready
```

P2

```
WAIT([R2]==1)           ; waits on flag
LDR R5, [R1]            ; reads new data
```

In the absence of barriers, an end result of P2: R5=0 is permissible.

##### *Resolving by the addition of barriers*

The addition of barriers, to ensure the observed order of the reads and the writes, ensures that data is transferred so that the result P2:R5==0x55 is guaranteed, as follows:

P1

```
STR R5, [R1]            ; sets new data
DMB [ST]                ; ensures all observers observe data before the flag
STR R0, [R2]            ; sends flag indicating data ready
```

P2

```
WAIT([R2]==1)           ; waits on flag
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
DMB                     ; ensures that the load of data is after the flag has been observed
LDR R5, [R1]
```

### *Resolving by the use of barriers and address dependency*

There is a rule within the ARM architecture that:

- Where the value returned by a read is used for computation of the virtual address of a subsequent read or write, then these two memory accesses are observed in program order.

  Where the value returned by a read is used for computation of the virtual address of a subsequent read or write, this is called an *address dependency*. An address dependency exists even if the value returned by the first read has no effect on the virtual address. This might occur if the value returned is masked off before it is used, or if it confirms a predicted address value that it might have changed.

  This restriction applies only when the data value returned by a read is used as a data value to calculate the address of a subsequent read or write. It does not apply if the data value returned by a read determines the condition flags values, and the values of the flags are used for condition code evaluation to determine the address of a subsequent read, either through conditional execution or the evaluation of a branch. This is called a *control dependency*.

  Where both a control and address dependency exist, the ordering behavior is consistent with the address dependency.

Table K10-1 shows examples of address dependencies, control dependencies, and an address and control dependency.

**Table K10-1 Dependency examples**

| **Address dependency** | | **Control dependency** | | **Address and control dependency**[a] |
|---|---|---|---|---|
| **(a)** | **(b)** | **(c)** | **(d)** | **(e)** |
| `LDR r1, [r0]` | `LDR r1, [r0]` | `LDR r1, [r0]` | `LDR r1, [r0]` | `LDR r1, [r0]` |
| `LDR r2, [r1]` | `AND r1, r1, #0` | `CMP r1, #55` | `CMP r1, #55` | `CMP r1, #0` |
| | `LDR r2, [r3, r1]` | `LDRNE r2, [r3]` | `MOVNE r4, #22` | `LDRNE r2, [r1]` |
| | | | `LDR r2, [r3, r4]` | |

a. The address dependency takes priority.

This means that the data transfer example of *Weakly-ordered message passing problem* on page K10-5633 can also be satisfied as shown in the following example:

P1

```
STR R5, [R1]            ; sets new data
DMB [ST]                ; ensures all observers observe data before the flag
STR R0, [R2]            ; sends flag indicating data ready
```

P2

```
WAIT([R2]==1)
AND R12, R12, #0        ; R12 is destination of LDR in WAIT macro
LDR R5, [R1, R12]       ; the load has an address dependency on R12
                        ; and so is ordered after the flag has been seen
```

The load of R5 by P2 is ordered with respect to the load from [R2] because there is an address dependency using R12. P1 uses a `DMB` to ensure that P2 does not observe the write of [R2] before the write of [R1].

*Non-Confidential - Beta*

#### Message passing with multiple observers

Where the ordering of Normal memory accesses is not resolved by the use of barriers or dependencies, then different observers might observe the accesses in a different order, as shown in the following example:

P1

```
STR R5, [R1]            ; sets new data
STR R0, [R2]            ; sends flag indicating data ready
```

P2

```
WAIT([R2]==1)
AND R12, R12, #0        ; R12 is destination of LDR in WAIT macro
LDR R5, [R1, R12]       ; the load has an address dependency on R12
                        ; and so is ordered after the flag has been seen
```

P3

```
WAIT([R2]==1)
AND R12, R12, #0        ; R12 is destination of LDR in WAIT macro
LDR R5, [R1, R12]       ; the load is address depndent on R12
                        ; and so is ordered after the flag has been seen
```

In this case, it is permissible for P2:R5 and P3:R5 to contain different values, because there is no order guaranteed between the two stores performed by P1.

#### Resolving by the addition of barriers

The addition of a barrier by P1, as shown in the following example, ensures the observed order of the writes, transferring data so that P2:R5 and P3:R5 both contain the value `0x55`:

P1

```
STR R5, [R1]            ; sets new data
DMB [ST]                ; ensures all observers observe data before the flag
STR R0, [R2]            ; sends flag indicating data ready
```

P2

```
WAIT([R2]==1)
AND R12, R12, #0        ; R12 is the destination of LDR in WAIT macro
LDR R5, [R1, R12]       ; the load has an address dependency on R12
                        ; and so is ordered after the flag has been seen
```

P3

```
WAIT([R2]==1)
AND R12, R12, #0        ; R12 is the destination of LDR in WAIT macro
LDR R5, [R1, R12]       ; the load has an address dependency on R12
                        ; and so is ordered after the flag has been seen
```

### Address dependency with object construction

When accessing an object-oriented data structure, the address dependency rule means that barriers are not required, even when initializing the object:

P1

```
STR R5, [R1, #offset]   ; sets new data in a field
DMB [ST]                ; ensures all observers observe data before base address is updated
STR R1, [R2]            ; updates base address
```

P2

```
LDR R1, [R2]            ; reads for base address
CMP R1, #0              ; checks if it is valid
BEQ null_trap
LDR R5, [R1, #offset]   ; uses base address to read field
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If the null_trap is not taken, it is required that P2:R5==0x55. This avoids P2 observing a partially constructed object from P1. Significantly, P2 does not require a barrier to ensure this behavior.

P1 requires a barrier to ensure the observed order of the writes by P1. In general, the impact of requiring a barrier during the construction phase is much less than the impact of requiring a barrier for every read access.

### Causal consistency issues with multiple observers

The fact that different observers can observe memory accesses in different orders extends, in the absence of barriers, to behaviors that do not fit naturally expected causal properties, as the following example shows:

P1

```
    STR R0, [R2]            ; sets new data
```

P2

```
    WAIT([R2]==1)           ; waits to see new data from P1
    STR R0, [R3]            ; sends flag, must be after the new data has been by P2 as stores,
                            ; must not be speculative
```

P3

```
    WAIT([R3]==1)           ; waits for P2 flag
    AND R12, R12, #0        ; dependency to ensure order
    LDR R0, [R2, R12]       ; reads P1's data
```

In this example, P3:R0==0 is permissible. P3 is not guaranteed to seethe stores from P1 and P2 in any particular order. This applies despite the fact that the store from P2 can only happen after P2 has observed the store from P1.

This example shows that the ARM memory order model for Normal memory does not conform to c*ausal consistency*. This means that the apparently transitive causal relationship between two variables is not guaranteed to be transitive.

The following example shows the insertion of a barrier by P2 to create causal consistency:

P1

```
    STR R0, [R2]            ; sets new data
```

P2

```
    WAIT([R2]==1)           ; waits to see new data from P1
    DMB                     ; ensures P1 data is observed by all observers before any following store
    STR R0, [R3]            ; sends flag
```

P3

```
    WAIT([R3]==1)           ; waits for P2 flag
    AND R12, R12, #0        ; dependency to ensure order
    LDR R0, [R2, R12]       ; reads P1 data
```

This creates causal consistency because a DMB is required to order all accesses that the executing PE observed before the DMB, not only those it issued, before any of the accesses that follow the DMB.

### Multiple observers of writes to multiple locations

The ARM weakly consistent memory model means that different observers can observe writes to different locations in different orders, as the following example shows:

P1

```
    STR R0, [R1]            ; sets new data
```

P2

```
    STR R0, [R2]            ; sets new data
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

P3

```
    LDR R10, [R2]            ; reads P2 data before P1 data
    LDR R9, [R1]             ;
    BIC R9, R10, R9          ; R9 <- R10 && ~R9
                             ; R9 contains 1 iff read from [R2] is observed to be 1 and
                             ; read from [R1] is observed to be 0.
```

P4

```
    LDR R9, [R1]
    LDR R10, [R2]
    BIC  R9, R9, R10         ; R9 <- R9 && ~R10
                             ; R9 contains 1 iff read from [R2] is observed to be 0 and
                             ; read from [R1] is observed to be 1.
```

In this example, the result P3:R9==1 and P4:R9==1 is permissible. This means that P3 and P4 observed the stores from P1 and P2 in different orders.

The following example shows the use of `DMB` instructions to ensure sequential consistency:

P1

```
    STR R0, [R1]             ; sets new data
```

P2

```
    STR R0, [R2]             ; sets new data
```

P3

```
    LDR R10, [R2]            ; reads P2 data before P1 data
    DMB
    LDR R9, [R1]
    BIC R9, R10, R9          ; R9 <- R10 && ~R9
                             ; R9 contains 1 iff read from [R2] is observed to be 1 and
                             ; read from [R1] is observed to be 0.
```

P4

```
    LDR R9, [R1]             ; reads P1 data before P2 data
    DMB
    LDR R10, [R2]
    BIC  R9, R9, R10         ; R9 <- R9 && ~R10
                             ; R9 contains 1 iff read from [R2] is observed to be 0 and
                             ; read from [R1] is observed to be 1.
```

In this example:

- The `DMB` executed by P3 ensures that, if the P3 load from [R2] observes the P2 store to [R2], then all observers observe the P2 store to [R2] before they observe the P3 load from [R1].
- The `DMB` executed by P4 ensures that, if the P4 load from [R1] observes the P1 store to [R1], then all observers observe the P1 store to [R1 before they observe the P4 load from [R2].

If the P3 load from [R1] returns 0, then it has not observed the P1 store to [R1]. Also, if the P3 load of [R2] returns 1, then all observers must have observed the P2 store to [R2] before they observed the P1 store to [R1]. This means that P4 cannot observe the P1 store to [R1] without also observing the P2 store to [R2].

Alternatively, if the P4 load from [R2] returns 0, then it has not observed the P2 store to [R2]. If, also, the P4 load of [R1] returns 1, then all observers must have observed the P1 store to [R1] before they observed the P2 store to [R2]. This means that P3 cannot observe the P2 store to [R2] without also observing the P1 store to [R1].

This shows that, of the four possible results for {P3:R9, P4:R9}, the insertion of these barriers makes the result {1, 1} impossible.

### Posting a store before polling for acknowledgement

In the case where an observer stores to a location, and then polls for an acknowledge from a different observer, the weak ordering of the memory model can lead to a deadlock, as the following example shows:

P1

```
STR R0, [R2]
WAIT ([R3]==1)
```

P2

```
WAIT ([R2]==1)
STR R0, [R3]
```

In ARMv7 implementations that do not include the Multiprocessing Extensions, then this can deadlock because P2 might not observe the store by P1 in finite time. For ARMv7 implementations with the Multiprocessing Extensions and for ARMv8, this is not an issue as all stores must be observed by all observers within their shareability domain in finite time.

The addition of a `DMB` instruction prevents this deadlock in ARMv7 implementations that do not include the Multiprocessing Extensions:

P1

```
STR R0, [R2]
DMB
WAIT ([R3]==1)
```

P2

```
WAIT ([R2]==1)
STR R0, [R3]
```

The `DMB` executed by P1 ensures that P2 observes the store by P1 before it observes the load by P1. This ensures a timely completion.

The following example is a variant of the previous example, where the two observers poll the same memory location:

P1

```
STR R0, [R2]
WAIT ([R2]==2)
```

P2

```
WAIT ([R2]==1)
LDR R0, [R2]
ADD R0, R0, #1
STR R0, [R2]
```

In this example, the same deadlock can occur in ARMv7 implementations that do not include the Multiprocessing Extensions, because the architecture permits P1 to read the result of its own store to [R2] early, and continue doing so for an indefinite amount of time. The addition of a `DMB` instruction prevents this deadlock:

P1

```
STR R0, [R2]
DMB
WAIT ([R2]==2)
```

P2

```
WAIT ([R2]==1)
LDR R0, [R2]
ADD R0, R0, #1
STR R0, [R2]
```

### WFE and WFI and barriers

The Wait For Event and Wait For Interrupt instructions permit the PE to suspend execution and enter a low-power state. A DSB barrier instruction is required if it is necessary to ensure that memory accesses made before the WFI or WFE are visible to other observers, unless some other mechanism has ensured this visibility. Examples of other mechanism that would guarantee the required visibility are the DMB described in *Posting a store before polling for acknowledgement* on page K10-5638, or a dependency on a load.

The following example requires the DSB to ensure that the store is visible:

P1

```
    STR R0, [R2]
    DSB
Loop
    WFI
    B Loop
```

However, if the example in *Posting a store before polling for acknowledgement* on page K10-5638 is extended to include a WFE, there is no risk of a deadlock. The extended example is:

P1

```
    STR R0, [R2]
    DMB
Loop
    LDR R12, [R3]
    CMP R12, #1
    WFENE
    BNE Loop
```

P2

```
    WAIT ([R2]==1)
    STR R0, [R3]
    DSB
    SEV
```

In this example:

- The DMB by P1 ensures that P2 observes the store by P1 before it observes the load by P1.
- The dependency of the WFE on the result of the load by P1 means that this load must complete before P1 executes the WFE.

For more information about SEV, see *Use of Wait For Event (WFE) and Send Event (SEV) with locks* on page K10-5640.

## K10.6.2 Load-Exclusive, Store-Exclusive and barriers

The Load-Exclusive and Store-Exclusive instructions, described in *Synchronization and semaphores* on page B2-107, are predictable only with Normal memory. These instructions do not have any implicit barrier functionality. Therefore, any use of these instructions to implement locks of any type requires the addition of explicit barriers.

### Acquiring a lock

A common use of Load-Exclusive and Store-Exclusive instructions is to claim a lock to permit entry into a critical region. This is typically performed by testing a lock variable that indicates 0 for a free lock and some other value, commonly 1 or an identifier of the process holding the lock, for a taken lock.

The lack of implicit barriers in the Load-Exclusive and Store-Exclusive instructions means that the mechanism requires a DMB instruction between acquiring a lock and making the first access to the critical region, to ensure that all observers observe the successful claim of the lock before they observe any subsequent loads or stores to the region. This example shows Px acquiring a lock:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

P*x*

```
Loop
    LDREX R5, [R1]           ; reads lock
    CMP R5, #0               ; checks if 0
    STREXEQ R5, R0, [R1]     ; attempts to store new value
    CMPEQ R5, #0             ; tests if store succeeded
    BNE Loop                 ; retries if not
    DMB                      ; ensures that all subsequent accesses are observed after the
                             ; gaining of the lock is observed
    ; loads and stores in the critical region can now be performed
```

### Releasing a lock

The converse operation of releasing a lock does not require the use of Load-Exclusive and Store-Exclusive instructions, because only a single observer is able to write to the lock. However, often it is necessary for any observer to observe any memory updates, or any values that are loaded into memory, before they observe the release of the lock. Therefore, a `DMB` usually precedes the lock release, as the following example shows.

P*x*

```
    ; loads and stores in the critical region
    MOV R0, #0
    DMB                      ; ensures all previous accesses are observed before the lock is cleared
    STR R0, [R1]             ; clears the lock
```

### Use of Wait For Event (WFE) and Send Event (SEV) with locks

The ARMv8 architecture includes Wait For Event and Send Event instructions, that can be executed to reduce the required number of iterations of a lock-acquire loop, or *spinlock*, to reduce power. The basic mechanism involves an observer that is in a spinlock executing a `WFE` instruction that suspends execution on that observer until an asynchronous exception or an explicit event, sent by some other observer using the `SEV` instruction, is seen by the suspended observer. An observer that holds the lock executes an `SEV` instruction to send an event after it has released the lock.

The Event signal is a non-memory communication, and therefore the memory update that releases the lock must be observable by all observers before the `SEV` instruction is executed and the event is sent. This requires the use of `DSB` instruction, rather than `DMB`.

Therefore, the following is an example of lock acquire code using `WFE`:

P*x*

```
Loop
    LDREX R5, [R1]           ; reads lock
    CMP R5, #0               ; checks if 0
    WFENE                    ; sleeps if the lock is held
    STREXEQ R5, R0, [R1]     ; attempts to store new value
    CMPEQ R5, #0             ; tests if store succeeded
    BNE Loop                 ; retries if not
    DMB                      ; ensures that all subsequent accesses are observed after the
                             ; gaining of the lock is observed
    ; loads and stores in the critical region can now be performed
```

And the following is an example of lock release code using `SEV`:

P*x*

```
    ; loads and stores in the critical region
    MOV R0, #0
    DMB                      ; ensures all previous accesses are observed before the lock is cleared
    STR R0, [R1]             ; clears the lock
    DSB                      ; ensures completion of the store that cleared the lock before
                             ; sending the event
    SEV
```

*Non-Confidential - Beta*

### K10.6.3 Using a mailbox to send an interrupt

In some message passing systems, it is common for one observer to update memory and then notify a second observer of the update by sending an interrupt, using a mailbox.

Although a memory access might be made to initiate the sending of the mailbox interrupt, a DSB instruction is required to ensure the completion of previous memory accesses.

Therefore, the following sequence is required to ensure that P2 observes the updated value:

P1

```
STR R5, [R1]            ; message stored to shared memory location
DSB [ST]
STR R1, [R4]            ; R4 contains the address of a mailbox
```

P2

```
; interrupt service routine
LDR R5, [R1]
```

**Note**

The DSB executed by P1 ensures global observation of the store to [R1].The interrupt timing ensures that the code executed by P2 is executed after the global observation of the update to [R1], and therefore must see this update. In some implementations, this might be implemented by requiring that interrupts flush non-coherent buffers that hold speculatively loaded data.

### K10.6.4 Cache and TLB maintenance instructions and barriers

The following sections describe the use of barriers with cache and TLB maintenance instructions:

- *Data cache maintenance instructions*.
- *Instruction cache maintenance instructions* on page K10-5643.
- *TLB maintenance instructions and barriers* on page K10-5645.

#### Data cache maintenance instructions

The following sections describe the use of barriers with data cache maintenance instructions:

- *Message passing to non-caching observers*.
- *Multiprocessing message passing to non-caching observers* on page K10-5642.
- *Invalidating DMA buffers, non-functional example* on page K10-5642.
- *Invalidating DMA buffers, functional example with single PE* on page K10-5642.
- *Invalidating DMA buffers, functional example with multiple coherent PEs* on page K10-5643.

##### *Message passing to non-caching observers*

The ARMv8 architecture requires the use of DMB instructions to ensure the ordering of data cache maintenance instructions and their effects. This means the following message passing approaches can be used when communicating between caching observers and non-caching observers:

P1

```
STR R5, [R1]            ; updates data (assumed to be in P1's cache)
DCCMVAC R1              ; cleans cache to point of coherency
DMB                     ; ensures effects of the clean will be observed before the flag is set
STR R0, [R4]            ; sends flag to external agent (Non-cacheable location)
```

E1

```
WAIT ([R4] == 1)        ; waits for the flag
DMB                     ; ensures that flag has been seen before reading data
LDR R5, [R1]            ; reads the data
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

In this example, it is required that E1:R5==0x55.

### *Multiprocessing message passing to non-caching observers*

The broadcast nature of the cache maintenance instructions in ARMv8, and in ARMv7 implementations that include the Multiprocessing Extensions, combined with properties of barriers, means that the message passing principle for non-caching observers is:

P1

```
STR R5, [R1]            ; updates data (assumed to be in P1's cache)
DMB [ST]                ; ensures new data is observed before the flag to P2 is set
STR R0, [R2]            ; sends flag to P2
```

P2

```
WAIT ([R2] == 1)        ; waits for flag from P1
DMB                     ; ensures cache clean is observed after P1 flag is observed
DCCMVAC R1              ; cleans cache to point of coherency - this cleans the cache of P1
DMB                     ; ensures effects of the clean are observed before the flag to E1 is set
STR R0, [R4]            ; sends flag to E1
```

E1

```
WAIT ([R4] == 1)        ; waits for flag from P2
DMB                     ; ensures that flag has been observed before reading the data
LDR R5, [R1]            ; reads the data
```

In this example, it is required that E1:R5==0x55. The clean operation executed by P2 affects the data location in the P1 cache. The cast-out from the P1 cache is guaranteed to be observed before P2 updates [R4].

### *Invalidating DMA buffers, non-functional example*

The basic scheme for communicating with an external observer that is a process that passes data in to a Cacheable memory region must take account of the architectural requirement that regions marked as Cacheable can be allocated into a cache at any time, for example as a result of speculation. The following example shows this possibility:

P1

```
DCIMVAC R1              ; ensures caches are not dirty. A clean operation could be
                        ; used but the DMA overwrites this region so an invalidate operation
                        ; is sufficient and usually more efficient
DMB                     ; ensures cache invalidation is observed before the next store is observed
STR R0, [R3]            ; sends flag to external agent
WAIT ([R4]==1)          ; waits for a different flag from an external agent
DMB                     ; observes flag from external agent before reading new data. However [R1]
                        ; could have been brought into cache earlier
LDR R5, [R1]
```

E1

```
WAIT ([R3] == 1)        ; waits for flag
STR R5, [R1]            ; stores new data
DMB
STR R0, [R4]            ; sends a flag
```

If a speculative access occurs, there is no guarantee that the cache line containing [R1] is not brought back into the cache after the cache invalidation, but before [R1] is written by E1. Therefore, the result P1:R5=0 is permissible.

### *Invalidating DMA buffers, functional example with single PE*

P1

```
DCIMVAC R1              ; ensures cache is not dirty. A clean operation could be
                        ; used but the DMA overwrites this region so an invalidate operation
                        ; is sufficient and usually more efficient
DMB                     ; ensures cache invalidation is observed before the next store is observed
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

```
    STR R0, [R3]            ; sends flag to external agent
    WAIT ([R4]==1)          ; waits for a different flag from an external agent
    DMB                     ; ensures that cache invalidate is observed after the flag
                            ; from external agent is observed
    DCIMVAC R1              ; ensures cache discards stale copies before use
    LDR R5, [R1]
```

E1

```
    WAIT ([R3] == 1)        ; waits for flag
    STR R5, [R1]            ; stores new data
    DMB [ST]
    STR R0, [R4]            ; sends a flag
```

In this example, the result P1:R5 == `0x55` is required. Including a cache invalidation after the store by E1 to [R1] is observed ensures that the line is fetched from external memory after it has been updated.

#### *Invalidating DMA buffers, functional example with multiple coherent PEs*

The broadcasting of cache maintenance instructions, and the use of `DMB` instructions to ensure their observability, means that the previous example extends naturally to a multiprocessor system. Typically this requires a transfer of ownership of the region that the external observer is updating.

P0

```
    (Use data from [R1], potentially using [R1] as scratch space)
    DMB
    STR R0, [R2]            ; signals release of [R1]
    WAIT ([R2] == 0)        ; waits for new value from DMA
    DMB
    LDR R5, [R1]
```

P1

```
    WAIT ([R2] == 1)        ; waits for release of [R1] by P0
    DCIMVAC R1              ; ensures caches are not dirty, invalidate is sufficient
    DMB
    STR R0, [R3]            ; requests new data for [R1]
    WAIT ([R4] == 1)        ; waits for new data
    DMB
    DCIMVAC R1              ; ensures caches discard stale copies before use
    DMB
    MOV R0, #0
    STR R0, [R2]            ; signals availability of new [R1]
```

E1

```
    WAIT ([R3] == 1)        ; waits for new data request
    STR R5, [R1]            ; sends new [R1]
    DMB [ST]
    STR R0, [R4]            ; indicates new data available to P1
```

In this example, the result P0:R5 == `0x55` is required. The `DMB` issued by P1 after the first data cache invalidation ensures that effect of the cache invalidation on P0 is seen by E1 before the store by E1 to [R1]. The `DMB` issued by P1 after the second data cache invalidation ensures that its effects are seen before the store of 0 to the semaphore location in [R2].

### Instruction cache maintenance instructions

The following sections describe the use of barriers with instruction cache maintenance instructions:

- *Ensuring the visibility of updates to instructions for a uniprocessor* on page K10-5644.
- *Ensuring the visibility of updates to instructions for a multiprocessor* on page K10-5644.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Ensuring the visibility of updates to instructions for a uniprocessor

On a single PE, the agent that causes instruction fetches, or instruction cache linefills, is a separate memory system observer from the agent that causes data accesses. Therefore, any operations to invalidate the instruction cache can rely only on seeing updates to memory that are complete. This must be ensured by the use of a `DSB` instruction.

Also, instruction cache maintenance instructions are only guaranteed to complete after the execution of a `DSB`, and an `ISB` is required to discard any instructions that might have been prefetched before the instruction cache invalidation completed. Therefore, on a uniprocessor, to ensure the visibility of an update to code and to branch to it, the following sequence is required:

P1

```
STR R11, [R1]           ; R11 contains a new instruction to store in program memory
DCCMVAU R1              ; clean to PoU makes new instructions visible to instruction cache
DSB
ICIMVAU R1              ; ensures instruction cache and branch predictor discard stale data
BPIMVA R1
DSB                     ; ensures completion of the invalidation
ISB                     ; ensures instruction fetch path observes new instruction cache state
BX R1
```

### Ensuring the visibility of updates to instructions for a multiprocessor

ARMv8, and an ARMv7 implementation that includes the Multiprocessing Extensions, requires a PE that executes an instruction cache maintenance instruction to execute a `DSB` instruction to ensure completion of the maintenance operation. This ensures that the cache maintenance instruction is complete on all PEs in the Inner Shareable shareability domain.

An `ISB` is not broadcast, and so does not affect other PEs. This means that any other PE must perform its own `ISB` synchronization after it knows that the update is visible, if it is necessary to ensure its synchronization with the update. The following example shows how this might be done:

P1

```
STR R11, [R1]           ; R11 contains a new instruction to store in program memory
DCCMVAU R1              ; clean to PoU makes new instructions visible to instruction cache
DSB                     ; ensures completion of the clean on all processors
ICIMVAU R1              ; ensures instruction cache/branch predictor discards stale data
BPIMVA R1
DSB                     ; ensures completion of the instruction cache and branch predictor
                        ; invalidation on all PEs
STR R0, [R2]            ; sets flag to signal completion
ISB                     ; synchronizes context on this PE
BX R1                   ; branches to new code
```

P2-P*x*

```
WAIT ([R2] == 1)        ; waits for flag signaling completion
ISB                     ; synchronizes context on this processor
BX R1                   ; branches to new code
```

### Nonfunctional approach

The following sequence does not have the same effect, because a `DSB` is not required to complete the instruction cache maintenance instructions that other PEs issue:

P1

```
STR R11, [R1]           ; R11 contains a new instruction to store in program memory
DCCMVAU R1              ; clean to PoU makes new instructions visible to instruction cache
DSB                     ; ensure completion of the clean on all PEs
ICIMVAU R1              ; ensure instruction cache/branch predictor discards stale data
BPIMVA R1
DMB                     ; ensure ordering of the store after the invalidation
                        ; DOES NOT guarantee completion of instruction cache/branch
                        ; predictor on other PEs
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
STR R0, [R2]            ; sets flag to signal completion
DSB                     ; ensures completion of the invalidation on all PEs
ISB                     ; synchronizes context on this PE
BX R1                   ; branches to new code
```

P2-P*x*

```
WAIT ([R2] == 1)        ; waits for flag signaling completion
DSB                     ; this DSB does not guarantee completion of P1's ICIMVAU/BPIMVA
ISB
BX R1
```

In this example, P2…P*x* might not see the updated region of code at R1.

## TLB maintenance instructions and barriers

The following sections describe the use of barriers with TLB maintenance instructions:

- *Ensuring the visibility of updates to translation tables for a uniprocessor*.
- *Ensuring the visibility of updates to translation tables for a multiprocessor*.
- *Paging memory in and out* on page K10-5646.

### *Ensuring the visibility of updates to translation tables for a uniprocessor*

On a single PE, the agent that causes translation table walks is a separate memory system observer from the agent that causes data accesses. Therefore, any operations to invalidate the TLB can only rely on seeing updates to memory that are complete. This must be ensured by the use of a `DSB` instruction.

In the ARMv8 architecture, and in an ARMv7 implementation that includes the Multiprocessing Extensions, translation table walks must look in the data or unified caches at L1, so such systems do not require data cache cleaning.

After the translation tables update, any old copies of entries that might be held in the TLBs must be invalidated. This operation is only guaranteed to affect all instructions, including instruction fetches and data accesses, after the execution of a `DSB` and an `ISB`. Therefore, the code for updating a translation table entry is:

P1

```
STR R11, [R1]           ; updates the translation table entry
DSB                     ; ensures visibility of the update to translation table walks
TLBIMVA R10
BPIALL
DSB                     ; ensures completion of the BP and TLB invalidation
ISB                     ; synchronizes context on this PE
;
; new translation table entry can be relied upon at this point and all accesses
; generated by this observer using the old mapping have been completed
```

Importantly, by the end of this sequence, all accesses that used the old translation table mappings have been observed by all observers.

An example of this is where a translation table entry is marked as invalid. Such a system must provide a mechanism to ensure that any access to a region of memory being marked as invalid has completed before any action is taken as a result of the region being marked as invalid.

### *Ensuring the visibility of updates to translation tables for a multiprocessor*

The same code sequence can be used in a multiprocessing system. In the ARMv8 architecture, and in an ARMv7 implementation that includes the Multiprocessing Extensions, a PE that executes a TLB maintenance instruction must execute a `DSB` instruction to ensure completion of the maintenance operation. This ensures that the TLB maintenance instruction is complete on all PEs in the Inner Shareable shareability domain.

The completion of a `DSB` that completes a TLB maintenance instruction ensures that all accesses that used the old mapping have completed.

P1

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
STR R11, [R1]           ; updates the translation table entry
DSB                     ; ensures visibility of the update to translation table walks
TLBIMVAIS R10
BPIALLIS
DSB                     ; ensures completion of the BP and TLB invalidation
ISB                     ; Note ISB is not broadcast and must be executed locally on other PEs
;
; new translation table entry can be relied upon at this point and all accesses generated by any
; observers affected by the broadcast TLBIMVAIS operation using the old mapping have completed
```

The completion of the TLB maintenance instruction is guaranteed only by the execution of a DSB by the observer that performed the TLB maintenance instruction. The execution of a DSB by a different observer does not have this effect, even if the DSB is known to be executed after the TLB maintenance instruction is observed by that different observer.

### *Paging memory in and out*

In a multiprocessor system there is a requirement to ensure the visibility of translation table updates when paging regions of memory into RAM from a backing store. This might, or might not, also involve paging existing locations in memory from RAM to a backing store. In such situations, the operating system selects one or more pages of memory that might be in use but are suitable to discard, with or without copying to a backing store, depending on whether or not the region of memory is writable. Disabling the translation table mappings for a page, and ensuring the visibility of that update to the translation tables, prevents agents accessing the page.

For this reason, it is important that the DSB that is performed after the TLB invalidation ensures that no other updates to memory using those mappings are possible.

An example sequence for the paging out of an updated region of memory, and the subsequent paging in of memory, is as follows:

P1

```
STR R11, [R1]           ; updates the translation table for the region being paged out
DSB                     ; ensures visibility of the update to translation table walks
TLBIMVAIS R10           ; invalidates the old entry
DSB                     ; ensures completion of the invalidation on all processors
ISB                     ; ensures visibility of the invalidation
BL SaveMemoryPageToBackingStore
BL LoadMemoryFromBackingStore
DSB                     ; ensures completion of the memory transfer (this could be part of
                        ; LoadMemoryFromBackingStore
ICIALLUIS               ; also invalidates the branch predictor
STR R9, [R1]            ; creates a new translation table entry with a new mapping
DSB                     ; ensures completion of instruction cache and branch predictor invalidation
                        ; and ensures visibility of the new translation table mapping
ISB                     ; ensures synchronization of this instruction stream
```

This example assumes the memory copies are performed by an observer that is coherent with the caches of PE P1. This observer might be P1 itself, using a specific paging mapping. For clarity, the example omits the functional descriptions of SaveMemoryPageToBackingStore and LoadMemoryFromBackingStore. LoadMemoryFromBackingStore is required to ensure that the memory updates that it makes are visible to instruction fetches.

In this example, the use of ICIALLUIS to invalidate the entire instruction cache is a simplification, that might not be optimal for performance. An alternative approach involves invalidating all of the lines in the caches using ICIMVAU operations. This invalidation must be done when the mapping used for the ICIMVAU operations is valid but not executable.

# Appendix K11
# ARM Pseudocode Definition

This appendix provides a definition of the pseudocode that is used in this manual, and defines some *helper* procedures and functions that are used by pseudocode. It contains the following sections:

- *About the ARM pseudocode* on page K11-5648.
- *Pseudocode for instruction descriptions* on page K11-5649.
- *Data types* on page K11-5651.
- *Operators* on page K11-5656.
- *Statements and control structures* on page K11-5662.
- *Built-in functions* on page K11-5668.
- *Miscellaneous helper procedures and functions* on page K11-5671.
- *ARM pseudocode definition index* on page K11-5674.

**Note**

This appendix is not a formal language definition for the pseudocode. It is a guide to help understand the use of ARM pseudocode. This appendix is not complete. Changes are planned for future releases.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K11.1 About the ARM pseudocode

The ARM pseudocode provides precise descriptions of some areas of the ARM architecture. This includes description of the decoding and operation of all valid instructions. *Pseudocode for instruction descriptions* on page K11-6021 gives general information about this instruction pseudocode, including its limitations.

The following sections describe the ARM pseudocode in detail:

- *Data types* on page K11-6023.
- *Operators* on page K11-6028.
- *Statements and control structures* on page K11-6034.

*Built-in functions* on page K11-6040 and *Miscellaneous helper procedures and functions* on page K11-6043 describe some built-in functions and pseudocode helper functions that are used by the pseudocode functions that are described elsewhere in this manual. *ARM pseudocode definition index* on page K11-6046 contains the indexes to the pseudocode.

### K11.1.1 General limitations of ARM pseudocode

The pseudocode statements `IMPLEMENTATION_DEFINED`, `SEE`, `UNDEFINED`, and `UNPREDICTABLE` indicate behavior that differs from that indicated by the pseudocode being executed. If one of them is encountered:

- Earlier behavior indicated by the pseudocode is only specified as occurring to the extent required to determine that the statement is executed.
- No subsequent behavior indicated by the pseudocode occurs.

For more information, see *Special Statements* on page K11-6038.

Non-Confidential - Beta

## K11.2 Pseudocode for instruction descriptions

Each instruction description includes pseudocode that provides a precise description of what the instruction does, subject to the limitations described in *General limitations of ARM pseudocode* on page K11-6020 and *Limitations of the instruction pseudocode* on page K11-6022.

In the instruction pseudocode, instruction fields are referred to by the names shown in the encoding diagram for the instruction. *Instruction encoding diagrams and instruction pseudocode* gives more information about the pseudocode provided for each instruction.

### K11.2.1 Instruction encoding diagrams and instruction pseudocode

Instruction descriptions in this manual contain:

- An Encoding section, containing one or more encoding diagrams, each followed by some encoding-specific pseudocode that translates the fields of the encoding into inputs for the common pseudocode of the instruction, and picks out any encoding-specific special cases.
- An Operation section, containing common pseudocode that applies to all of the encodings being described. The Operation section pseudocode contains a call to the `EncodingSpecificOperations()` function, either at its start or only after a condition code check performed by `if ConditionPassed() then`.

An encoding diagram specifies each bit of the instruction as one of the following:

- An obligatory 0 or 1, represented in the diagram as 0 or 1. If this bit does not have this value, the encoding corresponds to a different instruction.
- A *should be* 0 or 1, represented in the diagram as (0) or (1). If this bit does not have this value, the instruction is UNPREDICTABLE. For more information, see *SBZ or SBO fields in instructions* on page K1-5798.
- A named single bit or a bit in a named multi-bit field. The `cond` field in bits[31:28] of many A32/T32 instructions has some special rules associated with it.

An encoding diagram matches an instruction if all obligatory bits are identical in the encoding diagram and the instruction, and one of the following is true:

- The encoding diagram is not for an A32/T32 instruction.
- The encoding diagram is for an A32/T32 instruction that does not have a `cond` field in bits[31:28].
- The encoding diagram is for an A32/T32 instruction that has a `cond` field in bits[31:28], and bits[31:28] of the instruction are not `0b1111`.

In the context of the instruction pseudocode, the execution model for an instruction is:

1. Find all encoding diagrams that match the instruction. It is possible that no encoding diagram matches. In that case, abandon this execution model and consult the relevant instruction set chapter instead to find out how the instruction is to be treated. The bit pattern of such an instruction is usually reserved and UNDEFINED, though there are some other possibilities. For example, unallocated hint instructions are documented as being reserved and executed as NOPs.
2. If the operation pseudocode for the matching encoding diagrams starts with a condition code check, perform that check. If the condition code check fails, abandon this execution model and treat the instruction as a NOP. If there are multiple matching encoding diagrams, either all or none of their corresponding pieces of common pseudocode start with a condition code check.
3. Perform the encoding-specific pseudocode for each of the matching encoding diagrams independently and in parallel. Each such piece of encoding-specific pseudocode starts with a bitstring variable for each named bit or multi-bit field in its corresponding encoding diagram, named the same as the bit or multi-bit field and initialized with the values of the corresponding bit or bits from the bit pattern of the instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

In a few cases, the encoding diagram contains more than one bit or field with same name. In these cases, the values of the different instances of those bits or fields must be identical. The encoding-specific pseudocode contains a special case using the `Consistent()` function to specify what happens if they are not identical. `Consistent()` returns `TRUE` if all instruction bits or fields with the same name as its argument have the same value, and `FALSE` otherwise.

If there are multiple matching encoding diagrams, all but one of the corresponding pieces of pseudocode must contain a special case that indicates that it does not apply. Discard the results of all such pieces of pseudocode and their corresponding encoding diagrams.

There is now one remaining piece of pseudocode and its corresponding encoding diagram left to consider. This pseudocode might also contain a special case, most commonly one indicating that it is UNPREDICTABLE. If so, abandon this execution model and treat the instruction according to the special case.

4. Check the *should be* bits of the encoding diagram against the corresponding bits of the bit pattern of the instruction. If any of them do not match, abandon this execution model and treat the instruction as UNPREDICTABLE.

5. Perform the rest of the operation pseudocode for the instruction description that contains the encoding diagram. That pseudocode starts with all variables set to the values they were left with by the encoding-specific pseudocode.

The `ConditionPassed()` call in the common pseudocode, if present, performs step 2, and the `EncodingSpecificOperations()` call performs steps 3 and 4.

### K11.2.2 Limitations of the instruction pseudocode

The pseudocode descriptions of instruction functionality have a number of limitations. These are mainly due to the fact that, for clarity and brevity, the pseudocode is a sequential and mostly deterministic language.

These limitations include:

- Pseudocode does not describe the ordering requirements when an instruction generates multiple memory accesses. For a description of the ordering requirements on memory accesses see *Ordering requirements* on page E2-2267.
- Pseudocode does not describe the exact rules when an UNDEFINED instruction fails its condition code check. In such cases, the `UNDEFINED` pseudocode statement lies inside the `if ConditionPassed() then …` structure, either directly or in the `EncodingSpecificOperations()` function call, and so the pseudocode indicates that the instruction executes as a NOP. *Conditional execution of undefined instructions* on page G1-3686 describes the exact rules.
- Pseudocode does not describe the exact ordering requirements when a single floating-point instruction generates more than one floating-point exception and one or more of those floating-point exceptions is trapped. *Combinations of floating-point exceptions* on page E1-2221 describes the exact rules.

  **Note**

  There is no limitation in the case where all the floating-point exceptions are untrapped, because the pseudocode specifies the same behavior as the cross-referenced section.

- An exception can be taken during execution of the pseudocode for an instruction, either explicitly as a result of the execution of a pseudocode function such as `Abort()`, or implicitly, for example if an interrupt is taken during execution of an `LDM` instruction. If this happens, the pseudocode does not describe the extent to which the normal behavior of the instruction occurs. To determine that, see the descriptions of the exceptions in *Handling exceptions that are taken to an Exception level using AArch32* on page G1-3647.

## K11.3 Data types

This section describes:

- *General data type rules*.
- *Bitstrings*.
- *Integers* on page K11-6024.
- *Reals* on page K11-6024.
- *Booleans* on page K11-6025.
- *Enumerations* on page K11-6025.
- *Tuples* on page K11-6025.
- *Structs* on page K11-6026.
- *Arrays* on page K11-6027.

### K11.3.1 General data type rules

ARM architecture pseudocode is a strongly typed language. Every literal and variable is of one of the following types:

- Bitstring.
- Integer.
- Boolean.
- Real.
- Enumeration.
- Tuple.
- Struct.
- Array.

The type of a literal is determined by its syntax. A variable can be assigned to without an explicit declaration. The variable implicitly has the type of the assigned value. For example, the following assignments implicitly declare the variables `x`, `y` and `z` to have types integer, bitstring of length 1, and Boolean, respectively.

```
x = 1;
y = '1';
z = TRUE;
```

Variables can also have their types declared explicitly by preceding the variable name with the name of the type. The following example declares explicitly that a variable named `count` is an integer.

```
integer count;
```

This is most often done in function definitions for the arguments and the result of the function.

The remaining subsections describe each data type in more detail.

### K11.3.2 Bitstrings

This section describes the bitstring data type.

#### Syntax

| | |
|---|---|
| `bits(N)` | The type name of a bitstring of length `N`. |
| `bit` | A synonym of `bits(1)`. |

#### Description

A bitstring is a finite-length string of 0s and 1s. Each length of bitstring is a different type. The minimum permitted length of a bitstring is 1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Bitstring constants literals are written as a single quotation mark, followed by the string of 0s and 1s, followed by another single quotation mark. For example, the two constants literals of type `bit` are `'0'` and `'1'`. Spaces can be included in bitstrings for clarity.

The bits in a bitstring are numbered from left to right *N*-1 to 0. This numbering is used when accessing the bitstring using bitslices. In conversions to and from integers, bit *N*-1 is the MSByte and bit 0 is the LSByte. This order matches the order in which bitstrings derived from encoding diagrams are printed.

Every bitstring value has a left-to-right order, with the bits being numbered in standard *little-endian* order. That is, the leftmost bit of a bitstring of length `N` is bit (*N*–1) and its right-most bit is bit 0. This order is used as the most-significant-to-least-significant bit order in conversions to and from integers. For bitstring constants and bitstrings that are derived from encoding diagrams, this order matches the way that they are printed.

Bitstrings are the only concrete data type in pseudocode, corresponding directly to the contents values that are manipulated in registers, memory locations, and instructions. All other data types are abstract.

### K11.3.3 Integers

This section describes the data type for integer numbers.

#### Syntax

`integer` The type name for the integer data type.

#### Description

Pseudocode integers are unbounded in size and can be either positive or negative. That is, they are mathematical integers rather than what computer languages and architectures commonly call integers. Computer integers are represented in pseudocode as bitstrings of the appropriate length, and the pseudocode provides functions to interpret those bitstrings as integers.

Integer literals are normally written in decimal form, such as `0`, `15`, `-1234`. They can also be written in C-style hexadecimal form, such as `0x55` or `0x80000000`. Hexadecimal integer literals are treated as positive unless they have a preceding minus sign. For example, `0x80000000` is the integer $+2^{31}$. If $-2^{31}$ needs to be written in hexadecimal, it must be written as `-0x80000000`.

### K11.3.4 Reals

This section describes the data type for real numbers.

#### Syntax

`real` The type name for the real data type.

#### Description

Pseudocode reals are unbounded in size and precision. That is, they are mathematical real numbers, not computer floating-point numbers. Computer floating-point numbers are represented in pseudocode as bitstrings of the appropriate length, associated with suitable and the pseudocode provides functions to interpret those bitstrings as reals.

Real constants literals are written in decimal form with a decimal point. This means `0` is an integer constant literal, but `0.0` is a real constant literal.

### K11.3.5 Booleans

This section describes the Boolean data type.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### Syntax

`boolean` The type name for the Boolean data type.

`TRUE` The two values a Boolean variable can take.

### Description

A Boolean is a logical `TRUE` or `FALSE` value.

**Note**

This is not the same type as `bit`, which is a bitstring of length 1. A Boolean can only take on one of two values: `TRUE` or `FALSE`.

## K11.3.6 Enumerations

This section describes the enumeration data type.

### Syntax and examples

`enumeration` Keyword to defined a new enumeration type.

```
enumeration Example {Example_One, Example_Two, Example_Three};
```

A definition of a new enumeration called `Example`, which can take on the values `Example_One`, `Example_Two`, `Example_Three`.

### Description

An enumeration is a defined set of named values.

An enumeration must contain at least one named value. A named value must not be shared between enumerations.

Enumerations must be defined explicitly, although a variable of an enumeration type can be declared implicitly by assigning one of the named values to it. By convention, each named value starts with the name of the enumeration followed by an underscore. The name of the enumeration is its *type name*, or *type*, and the named values are its possible *values*.

## K11.3.7 Structures

This section describes the structure data type.

### Syntax and examples

`type` The keyword used to declare the structure data type.

```
type ShiftSpec is (bits(2) shift, integer amount)
```

An example definition for a new structure called `ShiftSpec` that contains an bitstring member called `shift` and a integer member named `amount`. Structure definitions must not be terminated with a semicolon.

```
ShiftSpec abc;
```

A declaration of a variable named `abc` of type `ShiftSpec`.

```
abc.shift
```

Syntax to refer to the individual members within the structure variable.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Description

A structure is a compound data type composed of one or more data items. The data items can be of different data types. This can include compound data types. The data items of a structure are called its members and are named.

In the syntax section, the example defines a structure called `ShiftSpec` with two members. The first is a bitstring of length 2 named `shift` and the second is an integer named `amount`. After declaring a variable of that type named `abc`, the members of this structure are referred to as `abc.shift` and `abc.amount`.

Every definition of a structure creates a different type, even if the number and type of their members are identical. For example:

```
type ShiftSpec1 is (bits(2) shift, integer amount)
type ShiftSpec2 is (bits(2) shift, integer amount)
```

`ShiftSpec1` and `ShiftSpec2` are two different types despite having identical definitions. This means that the value in a variable of type `ShiftSpec1` cannot be assigned to variable of type `ShiftSpec2`.

## K11.3.8 Tuples

This section describes the tuple data type.

### Examples

```
(bits(32) shifter_result, bit shifter_carry_out)
```

An example of the tuple syntax.

```
(shift_t, shift_n) = ('00', 0);
```

An example of assigning values to a tuple.

### Description

A tuple is an ordered set of data items, separated by commas and enclosed in parentheses. The items can be of different types and a tuple must contain at least one data item.

Tuples are often used as the return type for functions that return multiple results. For example, in the syntax section, the example tuple is the return type of the function `Shift_C()`, which performs a standard A32/T32 shift or rotation. Its return type is a tuple containing two data items, with the first of type `bits(32)` and the second of type `bit`.

Each tuple is a separate compound data type. The compound data type is represented as a comma-separated list of ordered data types between parentheses. This means that the example tuple at the start of this section is of type `(bits(32), bit)`. The general principle that types can be implied by an assignment extends to implying the type of the elements in the tuple. For example, in the syntax section, the example assignment implicitly declares:

- `shift_t` to be of type `bits(2)`.
- `shift_n` to be of type `integer`.
- `(shift_t, shift_n)` to be a tuple of type `(bits(2), integer)`.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### K11.3.9 Arrays

This section describes the array data type.

#### Syntax

`array` The type name for the array data type.

```
array data_type array_name[A..B];
```

Declaration of an array of type `data_type`, which may be compound data type. It is named `array_name` and is indexed with an integer range from `A` to `B`.

#### Description

An array is an ordered set of fixed size containing items of a single data type. This can include compound data types. Pseudocode arrays are indexed by either enumerations or integer ranges. An integer range is represented by the lower inclusive end of the range, then `..`, then the upper inclusive end of the range.

For example:

The following example declares an array of 31 bitstrings of length 64, indexed from 0 to 30.

```
array bits(64) _R[0..30];
```

Arrays are always explicitly declared, and there is no notation for a constant literal array. Arrays always contain at least one element data item, because:

- Enumerations always contain at least one symbolic constant named value.
- Integer ranges always contain at least one integer.

An array declared with an enumeration type as the index must be accessed using enumeration values of that enumeration type. An array declared with an integer range type as the index must be accessed using integer values from that inclusive range. Accessing such an array with an integer value outside of the range is a coding error.

Arrays do not usually appear directly in pseudocode. The items that syntactically look like arrays in pseudocode are usually array-like functions such as `R[i]`, `MemU[address, size]` or `Elem[vector, i, size]`. These functions package up and abstract additional operations normally performed on accesses to the underlying arrays, such as register banking, memory protection, endian-dependent byte ordering, exclusive-access housekeeping and Advanced SIMD element processing. See *Function and procedure calls* on page K11-5662.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

# K11.4 Operators

This section describes:

- *Relational operators*.
- *Boolean operators*
- *Arithmetic operators* on page K11-6029

## K11.4.1 Relational operators

The following operations yield results of type `boolean`.

### Equality and non-equality

If two variables `x` and `y` are of the same type, their values can be tested for equality by using the expression `x == y` and for non-equality by using the expression `x != y`. In both cases, the result is of type `boolean`.

Both `x` and `y` must be of type `bits(N)`, `real` , `enumeration`, `boolean`, or `integer`. Named values from an `enumeration` can only be compared if they are both from the same `enumeration`. An exception is that a bitstring can be tested for equality with an integer to allow a `d==15` test.

A special form of comparison is defined with a bitstring literal that can contain bit values `'0'` , `'1'`, and `'x'`. Any bit with value `'x'` is ignored in determining the result of the comparison. For example, if `opcode` is a 4-bit bitstring, the expression `opcode == '1x0x'` matches the values `'1000'`, `'1100'`, `'1001'`, and `'1101'`. This is known as a bitmask.

**Note**

This special form is permitted in the implied equality comparisons in the `when` parts of `case … of …` structures.

### Comparisons

If `x` and `y` are integers or reals, then `x < y`, `x <= y`, `x > y`, and `x >= y` are less than, less than or equal, greater than, and greater than or equal comparisons between them, producing Boolean results.

### Set membership with `IN`

`<expression> IN {<set>}` produces `TRUE` if `<expression>` is a member of `<set>`. Otherwise, it is `FALSE`. `<set>` must be a list of expressions separated by commas.

## K11.4.2 Boolean operators

If `x` is a Boolean expression, then `!x` is its logical inverse.

If `x` and `y` are Boolean expressions, then `x && y` is the result of ANDing them together. As in the C language, if `x` is `FALSE`, the result is determined to be `FALSE` without evaluating `y`.

**Note**

This is known as short circuit evaluation.

If `x` and `y` are `booleans`, then `x || y` is the result of ORing them together. As in the C language, if `x` is `TRUE`, the result is determined to be `TRUE` without evaluating `y`.

**Note**

If `x` and `y` are `booleans` or Boolean expressions, then the result of `x != y` is the same as the result of exclusive-ORing `x` and `y` together. The operator `EOR` only accepts bitstring arguments.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### K11.4.3 Bitstring operators

The following operations can be applied only to bitstrings.

#### Logical operations on bitstrings

If x is a bitstring, NOT(x) is the bitstring of the same length obtained by logically inverting every bit of x.

If x and y are bitstrings of the same length, x AND y, x OR y, and x EOR y are the bitstrings of that same length obtained by logically ANDing, logically ORing, and exclusive-ORing corresponding bits of x and y together.

#### Bitstring concatenation and slicing

If x and y are bitstrings of lengths N and M respectively, then x:y is the bitstring of length N+M constructed by concatenating x and y in left-to-right order.

The bitstring slicing operator addresses specific bits in a bitstring. This can be used to create a new bitstring from extracted bits or to set the value of specific bits. Its syntax is x<integer_list>, where x is the integer or bitstring being sliced, and <integer_list> is a comma-separated list of integers enclosed in angle brackets. The length of the resulting bitstring is equal to the number of integers in <integer_list>. In x<integer_list>, each of the integers in <integer_list> must be:

- >= 0.
- < Len(x) if x is a bitstring.

The definition of x<integer_list> depends on whether integer_list contains more than one integer:

- If integer_list contains more than one integer, x<i, j, k,…, n> is defined to be the concatenation:

  x<i> : x<j> : x<k> : … : x<n>.

- If integer_list consists of just one integer i, x<i> is defined to be:
  - If x is a bitstring, '0' if bit i of x is a zero and '1' if bit i of x is a one.
  - If x is an integer, and y is the unique integer in the range 0 to 2^(i+1)-1 that is congruent to x modulo 2^(i+1). Then x<i> is '0' if y < 2^i and '1' if y >= 2^i.

    Loosely, this definition treats an integer as equivalent to a sufficiently long two's complement representation of it as a bitstring.

The notation for a range expression is i:j with i >= j is shorthand for the integers in order from i down to j, with both end values included. For example, instr<31:28> represents instr<31, 30, 29, 28>.

x<integer_list> is assignable provided x is an assignable bitstring and no integer appears more than once in <integer_list>. In particular, x<i> is assignable if x is an assignable bitstring and 0 <= i < Len(x).

Encoding diagrams for registers frequently show named bits or multi-bit fields. For example, the encoding diagram for the APSR shows its bit<31> as N. In such cases, the syntax APSR.N is used as a more readable synonym for APSR<31> as named bits can be referred to with the same syntax as referring to members of a struct. A comma-separated list of named bits enclosed in angle brackets following the register name allows multiple bits to be addressed simultaneously. For example, APSR.<N, C, Q> is synonymous with APSR <31, 29, 27>.

### K11.4.4 Arithmetic operators

Most pseudocode arithmetic is performed on integer or real values, with operands obtained by conversions from bitstrings and results converted back to bitstrings . As these data types are the unbounded mathematical types, no issues arise about overflow or similar errors.

#### Unary plus and minus

If x is an integer or real, then +x is x unchanged, -x is x with its sign reversed. Both are of the same type as x.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Addition and subtraction

If x and y are integers or reals, x+y and x-y are their sum and difference. Both are of type `integer` if x and y are both of type `integer`, and `real` otherwise.

There are two cases where the types of x and y can be different. A bitstring and an integer can be added together to allow the operation `PC + 4`. An integer can be subtracted from a bitstring to allow the operation `PC - 2`.

If x and y are bitstrings of the same length N, so that `N = Len(x) = Len(y)`, then x+y and x-y are the least significant *N* bits of the results of converting x and y to integers and adding or subtracting them. Signed and unsigned conversions produce the same result:

```
x+y = (SInt(x) + SInt(y))<N-1:0>
    = (UInt(x) + UInt(y))<N-1:0>
x-y = (SInt(x) - SInt(y))<N-1:0>
    = (UInt(x) - UInt(y))<N-1:0>
```

If x is a bitstring of length N and y is an integer, x+y and x-y are the bitstrings of length N defined by `x+y = x + y<N-1:0>` and `x-y = x - y<N-1:0>`. Similarly, if x is an integer and y is a bitstring of length M, x+y and x-y are the bitstrings of length M defined by `x+y = x<M-1:0> + y` and `x-y = x<M-1:0> - y`.

### Multiplication

If x and y are integers or reals, then `x * y` is the product of x and y. It is of type `integer` if x and y are both of type `integer`, and `real` otherwise.

### Division and modulo

If x and y are reals, then x/y is the result of dividing x by y, and is always of type `real`.

If x and y are integers, then `x DIV y` and `x MOD y` are defined by:

```
x DIV y = RoundDown(x/y)
x MOD y = x - y * (x DIV y)
```

It is a pseudocode error to use any of x/y, `x MOD y`, or `x DIV y` in any context where y can be zero.

### Scaling

If x and n are of type `integer`, then:

- `x << n = RoundDown(x * 2^n)`.
- `x >> n = RoundDown(x * 2^(-n))`.

### Raising to a power

If x is an integer or a real and n is an integer then x^n is the result of raising x to the power of n, and:

- If x is of type `integer` then x^n is of type `integer`.
- If x is of type `real` then x^n is of type `real`.

## K11.4.5 The assignment operator

The assignment operator is the = character, which assigns the value of the right-hand side to the left-hand side. An assignment statement takes the form:

```
<assignable_expression> = <expression>;
```

This following subsection defines valid expression syntax.

### General expression syntax

An expression is one of the following:

- A literal.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

- A variable, optionally preceded by a data type name to declare its type.
- The word `UNKNOWN` preceded by a data type name to declare its type.
- The result of applying a language-defined operator to other expressions.
- The result of applying a function to other expressions.

Variable names normally consist of alphanumeric and underscore characters, starting with an alphabetic or underscore character.

Each register defined in an ARM architecture specification defines a correspondingly named pseudocode bitstring variable, and that variable has the stated behavior of the register. For example, if a bit of a register is defined as RAZ/WI, then the corresponding bit of its variable reads as `'0'` and ignore writes.

An expression like `bits(32) UNKNOWN` indicates that the result of the expression is a value of the given type, but the architecture does not specify what value it is and software must not rely on such values. The value produced must not:

- Return information that cannot be accessed at the current or a lower level of privilege using instructions that are not UNPREDICTABLE or `CONSTRAINED UNPREDICTABLE` and do not return UNKNOWN values,
- Be promoted as providing any useful information to software.

**Note**

UNKNOWN values are similar to the definition of UNPREDICTABLE, but do not indicate that the entire architectural state becomes unspecified.

Only the following expressions are assignable. This means that these are the only expressions that can be placed on the left-hand side of an assignment.

- Variables.
- The results of applying some operators to other expressions.

  The description of each language-defined operator that can generate an assignable expression specifies the circumstances under which it does so. For example, those circumstances might require that one or more of the expressions the operator operates on is an assignable expression.
- The results of applying array-like functions to other expressions. The description of an array-like function specifies the circumstances under which it can generate an assignable expression.

**Note**

If the right-hand side in an assignment is a function returning a tuple, an item in the assignment destination can be written as - to indicate that the corresponding item of the assigned tuple value is discarded. For example:

```
(shifted, -) = LSL_C(operand, amount);
```

The expression on the right-hand side itself can be a tuple. For example:

```
(x, y) = (function_1(), function_2());
```

Every expression has a data type.

- For a literal, this data type is determined by the syntax of the literal.
- For a variable, there are the following possible sources for the data type
  - — An optional preceding data type name.
  - — A data type the variable was given earlier in the pseudocode by recursive application of this rule.
  - — A data type the variable is being given by assignment, either by direct assignment to the variable, or by assignment to a list of which the variable is a member.

  It is a pseudocode error if none of these data type sources exists for a variable, or if more than one of them exists and they do not agree about the type.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

- For a language-defined operator, the definition of the operator determines the data type.
- For a function, the definition of the function determines the data type.

### K11.4.6 Precedence rules

The precedence rules for expressions are:

1. Literals, variables and function invocations are evaluated with higher priority than any operators using their results, but see *Boolean operators* on page K11-6028.
2. Operators on integers follow the normal operator precedence rules of *exponentiation before multiply/divide before add/subtract*, with sequences of multiply/divides or add/subtracts evaluated left-to-right.
3. Other expressions must be parenthesized to indicate operator precedence if ambiguity is possible, but need not be if all permitted precedence orders under the type rules necessarily lead to the same result. For example, if `i`, `j` and `k` are integer variables, `i > 0 && j > 0 && k > 0` is acceptable, but `i > 0 && j > 0 || k > 0` is not.

### K11.4.7 Conditional expressions

If `x` and `y` are two values of the same type and `t` is a value of type `boolean`, then `if t then x else y` is an expression of the same type as `x` and `y` that produces `x` if `t` is `TRUE` and `y` if `t` is `FALSE`.

### K11.4.8 Operator polymorphism

Operators in pseudocode can be polymorphic, with different functionality when applied to different data types. Each resulting form of an operator has a different prototype definition. For example, the operator + has forms that act on various combinations of integers, reals and bitstrings.

Table K11-2 summarizes the operand types valid for each unary operator and the result type. Table K11-2 summarizes the operand types valid for each binary operator and the result type.

**Table K11-1 Result and operand types permitted for unary operators**

| Operator | Operand Type | Result Type |
|---|---|---|
| - | integer | integer |
| | real | real |
| NOT | bits(N) | bits(N) |
| ! | boolean | boolean |

**Table K11-2 Result and operand types permitted for binary operators**

| Operator | First operand type | Second operand type | Result type |
|---|---|---|---|
| == | bits(N) | integer | boolean |
| | | bits(N) | |
| | integer | integer | |
| | real | real | |
| | enumeration | enumeration | |
| | boolean | boolean | |
| != | bits(N) | bits(N) | boolean |
| | integer | integer | |
| | real | real | |
| <, > | integer | integer | boolean |
| <= , >= | real | real | |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table K11-2 Result and operand types permitted for binary operators (continued)**

| Operator | First operand type | Second operand type | Result type |
|---|---|---|---|
| +, - | integer | integer | integer |
| | real | real | real |
| | bits(N) | bits(N) | bits(N) |
| | | integer | |
| <<, >> | integer | integer | integer |
| * | integer | integer | integer |
| | real | real | real |
| | bits(N) | bits(N) | bits(N) |
| / | real | real | real |
| DIV | integer | integer | integer |
| MOD | integer | integer | integer |
| | bits(N) | integer | |
| &&, \|\| | boolean | boolean | boolean |
| AND, OR, EOR | bits(N) | bits(N) | bits(N) |
| ^ | integer | integer | integer |
| | real | integer | real |

*Non-Confidential - Beta*

## K11.5 Statements and control structures

This section describes the statements and program structures available in the pseudocode.

### K11.5.1 Statements and Indentation

A simple statement is either an assignment, a function call, or a procedure call. Each statement must be terminated with a semicolon.

Indentation normally indicates the structure in compound statements. The statements contained in structures such as `if … then … else …` or procedure and function definitions are indented more deeply than the statement structure itself. The end of a compound statement structure and their end is indicated by returning to the original indentation level or less.

Indentation is normally done by four spaces for each level. Standard indentation uses four spaces for each level of indent.

### K11.5.2 Function and procedure calls

This section describes how functions and procedures are defined and called in the pseudocode.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### Procedure and function definitions

A procedure definition has the form:

```
<procedure name>(<argument prototypes>)
    <statement 1>;
    <statement 2>;
    …
    <statement n>;
```

where `<argument prototypes>` consists of zero or more argument definitions, separated by commas. Each argument definition consists of a type name followed by the name of the argument.

**Note**

This first definition line is not terminated by a semicolon. This distinguishes it from a procedure call.

A function definition is similar, but also declares the return type of the function:

```
<return type> <function name>(<argument prototypes>)
    <statement 1>;
    <statement 2>;
    …
    <statement n>;
```

**Note**

A function or procedure name can include a "`.`". This is a convention used for functions that have similar but different behaviors in AArch32 and AArch64 states.

Array-like functions are similar, but are written with square brackets and have two forms. These two forms exist because reading from and writing to an array element require different functions. They are frequently used in memory operations. An array-like function definition with a return type is equivalent to reading from an array. For example:

```
<return type> <function name>[<argument prototypes>]
    <statement 1>;
    <statement 2>;
    …
    <statement n>;
```

Its related function definition with no return type is equivalent to writing to an array. For example:

```
<function name>[<argument prototypes>] = <value prototype>
    <statement 1>;
    <statement 2>;
    …
    <statement n>;
```

The value prototype determines what data type can be written to the array. The two related functions must share the same name, but the value prototype and return type can be different.

### Procedure calls

A procedure call has the form:

```
<procedure_name>(<arguments>);
```

### Return statements

A procedure return has the form:

```
return;
```

A function return has the form:

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

```
return <expression>;
```

where `<expression>` is of the type declared in the function prototype line.

### K11.5.3 Conditional control structures

This section describes how conditional control structures are used in the pseudocode.

#### if … then … else …

In addition to being a ternary operator, a multi-line `if … then … else …` structure can act as a control structure and has the form:

```
if <boolean_expression> then
    <statement 1>;
    <statement 2>;
    …
    <statement n>;

elsif <boolean_expression> then
    <statement a>;
    <statement b>;
    …
    <statement z>;
else
    <statement A>;
    <statement B>;
    …
    <statement Z>;
```

The block of lines consisting of `elsif` and its indented statements is optional, and multiple `elsif` blocks can be used.

The block of lines consisting of `else` and its indented statements is optional.

Abbreviated one-line forms can be used when the `then` part, and in the `else` part if it is present, contain only simple statements such as:

```
if <boolean_expression> then <statement 1>;
if <boolean_expression> then <statement 1>; else <statement A>;
if <boolean_expression> then <statement 1>; <statement 2>; else <statement A>;
```

**Note**

In these forms, `<statement 1>`, `<statement 2>` and `<statement A>` must be terminated by semicolons. This and the fact that the `else` part is optional distinguish its use as a control structure from its use as a ternary operator.

#### case … of …

A `case … of …` structure has the form:

```
case <expression> of
    when <literal values1>
        <statement 1>;
        <statement 2>;
        …
        <statement n>;

    when <literal values2>
        <statement 1>;
        <statement 2>;
        …
        <statement n>;

    … more "when" groups if required …
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

```
otherwise
    <statement A>;
    <statement B>;
    …
    <statement Z>;
```

In this structure, <literal values1> and <literal values2> consist of literal values of the same type as <expression>, separated by commas. There can be additional when groups in the structure. Abbreviated one line forms of when and otherwise parts can be used when they contain only simple statements.

If <expression> has a bitstring type, the literal values can also include bitstring literals containing 'x' bits, known as bitmasks. For details see *Equality and non-equality testing* on page K11-6028.

### K11.5.4 Loop control structures

This section describes the three loop control structures used in the pseudocode.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### repeat … until …

A `repeat … until …` structure has the form:

```
repeat
    <statement 1>;
    <statement 2>;
    …
    <statement n>;
until <boolean_expression>;
```

It executes the statement block at least once, and the loop repeats until `<boolean expression>` evaluates to `TRUE`. Variables explicitly declared inside the loop body have scope local to that loop and may not be accessed outside the loop body.

### while … do

A `while … do` structure has the form:

```
while <boolean_expression> do
    <statement 1>;
    <statement 2>;
    …
    <statement n>;
```

It begins executing the statement block only if the Boolean expression is true. The loop then runs until the expression is false.

### for …

A `for …` structure has the form:

```
for <assignable_expression> = <integer_expr1> to <integer_expr2>
    <statement 1>;
    <statement 2>;
    …
    <statement n>;
```

The `<assignable_expression>` is initialized to `<integer_expr1>` and compared to `<integer_expr2>`. If `<integer_expr1>` is less than `<integer_expr2>`, the loop body is executed and the `<assignable_expression>` incremented by one. This repeats until `<assignable expression>` is more than or equal to `<integer_expr2>`.

There is an alternate form:

```
for <assignable_expression> = <integer_expr1> downto <integer_expr2>
```

where `<integer_expr1>` is decremented after the loop body executes and continues until `<assignable expression>` is less than or equal than `<integer_expr2>`.

## K11.5.5 Special statements

This section describes statements with particular architecturally-defined behaviors.

### UNDEFINED

This subsection describes the statement:

```
UNDEFINED;
```

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is that the Undefined Instruction exception is taken.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### UNPREDICTABLE

This subsection describes the statement:

```
UNPREDICTABLE;
```

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is UNPREDICTABLE.

### SEE…

This subsection describes the statement:

```
SEE <reference>;
```

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is that nothing occurs as a result of the current pseudocode because some other piece of pseudocode defines the required behavior. The `<reference>` indicates where that other pseudocode can be found.

It usually refers to another instruction, but can also refer to another encoding or note of the same instruction.

### IMPLEMENTATION_DEFINED

This subsection describes the statement:

```
IMPLEMENTATION_DEFINED {"<text>"};
```

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is IMPLEMENTATION DEFINED. An optional `<text>` field can give more information.

## K11.5.6 Comments

The pseudocode supports two styles of comments:

- // starts a comment that is terminated by the end of the line.
- /* starts a comment that is terminated by */.

/**/ statements may not be nested, and the first */ ends the comment.

**Note**

Comment lines do not require a terminating semicolon.

*Non-Confidential - Beta*

## K11.6 Built-in functions

This section describes:

- *Bitstring manipulation functions*
- *Arithmetic functions* on page K11-6042

### K11.6.1 Bitstring manipulation functions

The following bitstring manipulation functions are defined:

#### Bitstring length and most significant bit

If x is a bitstring:

- The bitstring length function `Len(x)` returns the length of x as an integer.

#### Bitstring concatenation and replication

If x is a bitstring and n is an integer with `n >= 0`:

- `Replicate(x, n)` is the bitstring of length `n*Len(x)` consisting of n copies of x concatenated together.
- `Zeros(n)` = `Replicate('0', n)`.
- `Ones(n)` = `Replicate('1', n)`.

#### Bitstring count

If x is a bitstring, `BitCount(x)` is an integer result equal to the number of bits of x that are ones.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### Testing a bitstring for being all zero or all ones

If x is a bitstring:

- IsZero(x) produces TRUE if all of the bits of x are zeros and FALSE if any of them are ones
- IsZeroBit(x) produces '1' if all of the bits of x are zeros and '0' if any of them are ones.

IsOnes(x) and IsOnesBit(x) work in the corresponding ways. This means:

```
IsZero(x)    = (BitCount(x) == 0)
IsOnes(x)    = (BitCount(x) == Len(x))
IsZeroBit(x) = if IsZero(x) then '1' else '0'
IsOnesBit(x) = if IsOnes(x) then '1' else '0'
```

### Lowest and highest set bits of a bitstring

If x is a bitstring, and N = Len(x):

- LowestSetBit(x) is the minimum bit number of any of the bits of x that are ones. If all of its bits are zeros, LowestSetBit(x) = N.
- HighestSetBit(x) is the maximum bit number of any of the bits of x that are ones. If all of its bits are zeros, HighestSetBit(x) = -1.
- CountLeadingZeroBits(x) is the number of zero bits at the left end of x, in the range 0 to *N*. This means:

  CountLeadingZeroBits(x) = N - 1 - HighestSetBit(x).
- CountLeadingSignBits(x) is the number of copies of the sign bit of x at the left end of x, excluding the sign bit itself, and is in the range 0 to *N*-1. This means:

  CountLeadingSignBits(x) = CountLeadingZeroBits(x<N-1:1> EOR x<N-2:0>).

### Zero-extension and sign-extension of bitstrings

If x is a bitstring and i is an integer, then ZeroExtend(x, i) is x extended to a length of i bits, by adding sufficient zero bits to its left. That is, if i == Len(x), then ZeroExtend(x, i) = x, and if i > Len(x), then:

```
ZeroExtend(x, i) = Replicate('0', i-Len(x)) : x
```

If x is a bitstring and i is an integer, then SignExtend(x, i) is x extended to a length of i bits, by adding sufficient copies of its leftmost bit to its left. That is, if i == Len(x), then SignExtend(x, i) = x, and if i > Len(x), then:

```
SignExtend(x, i) = Replicate(TopBit(x), i-Len(x)) : x
```

It is a pseudocode error to use either ZeroExtend(x, i) or SignExtend(x, i) in a context where it is possible that i < Len(x).

### Converting bitstrings to integers

If x is a bitstring, SInt() is the integer whose two's complement representation is x.

UInt() is the integer whose unsigned representation is x.

Int(x, unsigned) returns either SInt(x) or UInt(x) depending on the value of its second argument.

## K11.6.2 Arithmetic functions

This section defines built-in arithmetic functions.

### Absolute value

If x is either of type real or integer, Abs(x) returns the absolute value of x. The result is the same type as x.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Rounding and aligning

If x is a real:

- `RoundDown(x)` produces the largest integer `n` such that `n <= x`.
- `RoundUp(x)` produces the smallest integer `n` such that `n >= x`.
- `RoundTowardsZero(x)` produces:
  - `RoundDown(x)` if `x > 0.0`.
  - `0` if `x == 0.0`.
  - `RoundUp(x)` if `x < 0.0`.

If x and y are both of type `integer`, `Align(x, y) = y * (x DIV y)`, and is of type `integer`.

If x is of type `bitstring` and y is of type `integer`, `Align(x, y) = (Align(UInt(x), y))<Len(x)-1:0>`, and is a `bitstring` of the same length as x.

It is a pseudocode error to use either form of `Align(x, y)` in any context where y can be 0. In practice, `Align(x, y)` is only used with y a constant power of two, and the bitstring form used with `y = 2^n` has the effect of producing its argument with its n low-order bits forced to zero.

### Maximum and minimum

If x and y are integers or reals, then `Max(x, y)` and `Min(x, y)` are their maximum and minimum respectively. x and y must both be of type integer or of type real. The function returns a value of the same type as its operands.

*Non-Confidential - Beta*

## K11.7 Miscellaneous helper procedures and functions

The functions described in this section are not part of the pseudocode specification. They are miscellaneous *helper* procedures and functions used by pseudocode that are not described elsewhere in this manual. Each has a brief description and a pseudocode prototype, except that the prototype is omitted where it is identical to the section title.

### K11.7.1 EndOfInstruction()

This procedure terminates processing of the current instruction.

```
EndOfInstruction();
```

### K11.7.2 GenerateAlignmentException()

This procedure generates the appropriate exception for an alignment error.

In this manual, `GenerateAlignmentException()` generates a Data Abort exception.

### K11.7.3 Hint_Debug()

This procedure supplies a hint to the debug system.

```
Hint_Debug(bits(4) option);
```

### K11.7.4 Hint_PreloadData()

This procedure performs a *preload data* hint.

```
Hint_PreloadData(bits(32) address);
```

### K11.7.5 Hint_PreloadDataForWrite()

This procedure performs a *preload data* hint with a probability that the use will be for a write.

```
Hint_PreloadDataForWrite(bits(32) address);
```

### K11.7.6 Hint_PreloadInstr()

This procedure performs a *preload instructions* hint.

```
Hint_PreloadInstr(bits(32) address);
```

### K11.7.7 Hint_Yield()

This procedure performs a *Yield* hint.

```
Hint_Yield();
```

### K11.7.8 IntegerZeroDivideTrappingEnabled()

This function returns `TRUE` if the trapping of divisions by zero in the integer division instructions `SDIV` and `UDIV` is enabled, and `FALSE` otherwise.

The ARMv8-A `SDIV` and `UDIV` implementation does not support trapping of integer division by zero and therefore this function always returns FALSE.

```
boolean IntegerZeroDivideTrappingEnabled();
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### K11.7.9 IsExternalAbort()

This function returns TRUE if the abort currently being processed is an external abort and FALSE otherwise. It is used only in exception entry pseudocode.

```
boolean IsExternalAbort(Fault type)
    assert type != Fault_None;

boolean IsExternalAbort(FaultRecord fault);
```

### K11.7.10 IsAsyncAbort()

This function returns TRUE if the abort currently being processed is an asynchronous abort, and FALSE otherwise. It is used only in exception entry pseudocode.

```
boolean IsAsyncAbort(Fault type)
    assert type != Fault_None;

boolean IsAsyncAbort(FaultRecord fault);
```

### K11.7.11 LSInstructionSyndrome()

This function returns the extended syndrome information for a fault reported in the HSR.

```
bits(11) LSInstructionSyndrome();
```

### K11.7.12 ProcessorID()

This function returns an integer that uniquely identifies the executing PE in the system.

```
integer ProcessorID();
```

### K11.7.13 RemapRegsHaveResetValues()

This function returns TRUE if the remap registers PRRR and NMRR have their IMPLEMENTATION DEFINED reset values, and FALSE otherwise.

```
boolean RemapRegsHaveResetValues();
```

### K11.7.14 ResetControlRegisters()

This function resets the System registers and memory-mapped control registers that have architecturally-defined reset values to those values. For more information about the affected registers see:

- *PE state on reset to AArch64 state* on page D1-1426.
- *PE state on reset into AArch32 state* on page G1-3712.

```
AArch64.ResetControlRegisters(boolean ResetIsCold)
AArch32.ResetControlRegisters(boolean ResetIsCold)
```

### K11.7.15 ThisInstr()

This function returns the bitstring encoding of the currently-executing instruction.

```
bits(32) ThisInstr();
```

**Note**

Currently, this function is used only on 32-bit instruction encodings.

### K11.7.16 ThisInstrLength()

This function returns the length, in bits, of the current instruction. This means it returns 32 or 16:

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

```
integer ThisInstrLength();
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K11.8 ARM pseudocode definition index

This section contains the following tables:

- Table K11-3 which contains the pseudocode data types.
- Table K11-4 which contains the pseudocode operators.
- Table K11-5 on page K11-5675 which contains the pseudocode keywords and control structures.
- Table K11-6 on page K11-5676 which contains the statements with special behaviors.

**Table K11-3 Index of pseudocode data types**

| Keyword | Meaning |
|---|---|
| `array` | Type name for the array type |
| `bit` | Keyword equivalent to `bits(1)` |
| `bits(N)` | Type name for the bitstring of length `N` data type |
| `boolean` | Type name for the Boolean data type |
| `enumeration` | Keyword to define a new enumeration type |
| `integer` | Type name for the integer data type |
| `real` | Type name for the real data type |
| `type` | Keyword to define a new structure |

**Table K11-4 Index of pseudocode operators**

| Operator | Meaning |
|---|---|
| `-` | Unary minus on integers or reals |
| | Subtraction of integers, reals and bitstrings |
| | Used in the left-hand side of an assignment or a tuple to discard the result |
| `+` | Unary plus on integers or reals |
| | Addition of integers, reals and bitstrings |
| `.` | Extract named member from a list |
| | Extract named bit or field from a register |
| `:` | Bitstring concatenation |
| | Integer range in bitstring extraction operator |
| `!` | Boolean NOT |
| `!=` | Comparison for inequality |
| `(…)` | Around arguments of procedure or function |
| `[…]` | Around array index |
| | Around arguments of array-like function |
| `*` | Multiplication of integers, reals, and bitstrings |
| `/` | Division of reals |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**Table K11-4 Index of pseudocode operators (continued)**

| Operator | Meaning |
|---|---|
| `&&` | Boolean AND |
| `<` | *Less than* comparison of integers and reals |
| `<…>` | Slicing of specified bits of bitstring or integer |
| `<<` | Multiply integer by power of 2 |
| `<=` | *Less than or equal* comparison of integers and reals |
| `=` | Assignment operator |
| `==` | Comparison for equality |
| `>` | *Greater than* comparison of integers and reals |
| `>=` | *Greater than or equal* comparison of integers and reals |
| `>>` | Divide integer by power of 2 |
| `\|\|` | Boolean OR |
| `^` | Exponential operator |
| `AND` | Bitwise AND of bitstrings |
| `DIV` | Quotient from integer division |
| `EOR` | Bitwise EOR of bitstrings |
| `IN` | Tests membership of a certain expression in a set of values |
| `MOD` | Remainder from integer division |
| `NOT` | Bitwise inversion of bitstrings |
| `OR` | Bitwise OR of bitstrings |

**Table K11-5 Index of pseudocode keywords and control structures**

| Operator | Meaning |
|---|---|
| `/*…*/` | Comment delimiters |
| `//` | Introduces comment terminated by end of line |
| `case … of …` | Control structure for the |
| `FALSE` | One of two values a Boolean can take (other than `TRUE`) |
| `for … = …to …` | Loop control structure, counting up from the initial value to the upper limit |
| `for … = … downto …` | Loop control structure, counting down from the initial value to the lower limit |
| `if … then … else …` | Condition expression selecting between two values |
| `if … then … else …` | Conditional control structure |
| `otherwise` | Introduces default case in `case … of …` control structure |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**Table K11-5 Index of pseudocode keywords and control structures (continued)**

| Operator | Meaning |
|---|---|
| `repeat … until …` | Loop control structure that runs at least once until the termination condition is satisfied |
| `return` | Procedure or function return |
| `TRUE` | One of two values a Boolean can take (other than `FALSE`) |
| `when` | Introduces specific case in `case … of …` control structure |
| `while … do …` | Loop control structure that runs until the termination condition is satisfied |

**Table K11-6 Index of special statements**

| Keyword | Meaning |
|---|---|
| `IMPLEMENTATION_DEFINED` | Describes IMPLEMENTATION DEFINED behavior |
| `SEE` | Points to other pseudocode to use instead |
| `UNDEFINED` | Cause Undefined Instruction exception |
| `UNKNOWN` | Unspecified value |
| `UNPREDICTABLE` | Unspecified behavior |

# Appendix K12
# **Pseudocode Index**

This appendix provides indexes to pseudocode definitions and to the pseudocode functions. It contains the following sections:

- *Pseudocode operators and keywords* on page K12-5678.
- *Pseudocode index* on page K12-5679.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K12.1 Pseudocode operators and keywords

See *ARM pseudocode definition index* on page K11-5674 for a full list of operators, keywords, data types, and control structures.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K12.2 Pseudocode index

Table K12-1 indexes the definitions of the pseudocode functions.

# Appendix K13
# **Registers Index**

This appendix provides indexes to the register descriptions in this manual. It contains the following sections:

- *Introduction and register disambiguation* on page K13-5708.
- *Alphabetical index of AArch64 registers and system instructions* on page K13-5713.
- *Functional index of AArch64 registers and system instructions* on page K13-5722.
- *Alphabetical index of AArch32 registers and system instructions* on page K13-5732.
- *Functional index of AArch32 registers and system instructions* on page K13-5740.
- *Alphabetical index of memory-mapped registers* on page K13-5750.
- *Functional index of memory-mapped registers* on page K13-5755.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## K13.1 Introduction and register disambiguation

In some sections of this manual, registers are referred to by a *general name*, where the description applies to more than one context. Generally, this is one of the following:

- The description applies to both AArch32 state and AArch64 state, and therefore the register names could apply to either AArch32 System registers or AArch64 System registers.
- The description applies to multiple Exception levels, and therefore at a particular Exception level the register names need to take the appropriate Exception. level suffix, _EL0, _EL1, _EL2, or _EL3.

The following sections disambiguate the general register names:

- *Register name disambiguation by Execution state*.
- *Register name disambiguation by Exception level* on page K13-5711.

### K13.1.1 Register name disambiguation by Execution state

Table K13-1 disambiguates the general names of the registers by Execution state.

**Table K13-1 Disambiguation of general names of registers by Execution state**

| General name | Short description | AArch64 register | AArch32 register |
|---|---|---|---|
| CONTEXTIDR | Context ID | CONTEXTIDR_EL1 | CONTEXTIDR |
| DBGBCR | Debug Breakpoint Control Registers | DBGBCR<n>_EL1 | DBGBCR<n> |
| DBGBVR | Debug Breakpoint Value Registers | DBGBVR<n>_EL1 | DBGBVR<n><br>DBGBXVR<n> |
| DBGCLAIMCLR | Debug CLAIM Tag Clear register | DBGCLAIMCLR_EL1 | DBGCLAIMCLR |
| DBGCLAIMSET | Debug CLAIM Tag Set register | DBGCLAIMSET_EL1 | DBGCLAIMSET |
| DBGDTRRX | Debug Data Transfer Register, Receive | DBGDTRRX_EL0 | DBGDTRRXint |
| DBGDTRTX | Debug Data Transfer Register, Transmit | DBGDTRTX_EL0 | DBGDTRTXint |
| DBGPRCR | Debug Power Control Register | DBGPRCR_EL1 | DBGPRCR |
| DBGVCR | Debug Vector Catch Register | DBGVCR32_EL2 | DBGVCR |
| DBGWCR | Debug Watchpoint Control Registers | DBGWCR<n>_EL1 | DBGWCR<n> |
| DBGWVR | Debug Watchpoint Value Registers | DBGWVR<n>_EL1 | DBGWVR<n> |
| DCCINT | Debug Comms Channel Interrupt Enable Register | MDCCINT_EL1 | DBGDCCINT |
| DCCSR | Debug Comms Channel Status Register | MDCCSR_EL0 | DBGDSCRint |
| DBGAUTHSTATUS | Debug Authentication Status | DBGAUTHSTATUS_EL1 | DBGAUTHSTATUS |
| DLR | Debug Link Register | DLR_EL0[31:0] | DLR |
| DSCR | Debug System Control Register | MDSCR_EL1 | DBGDSCRext |
| DSPSR | Debug Saved PE State Register | DSPSR_EL0 | DSPSR |
| FAR | Fault Address Register | FAR_EL1<br>FAR_EL2<br>FAR_EL3<br>HPFAR_EL2 | DFAR, IFAR<br>HDFAR, HIFAR<br>FAR_EL3<br>HPFAR |

**Table K13-1 Disambiguation of general names of registers by Execution state (continued)**

| General name | Short description | AArch64 register | AArch32 register |
|---|---|---|---|
| HCR | Hypervisor Configuration Register | HCR_EL2 | HCR<br>HCR2 |
| HDCR | Hyp or EL2 Debug Control Register | MDCR_EL2 | HDCR |
| HSCTLR | Hypervisor System Control Register | SCTLR_EL2 | HSCTLR |
| HTTBR | EL2 Translation Table Base Register | TTBR0_EL2 | HTTBR |
| ISR | Interrupt Status Register | ISR_EL1 | ISR |
| OSDLR | OS Double-Lock Register | OSDLR_EL1 | DBGOSDLR |
| OSDTRRX | OS Lock Data Transfer Register, Receive | OSDTRRX_EL1 | DBGDTRRXext |
| OSDTRTX | OS Lock Data Transfer Register, Transmit | OSDTRTX_EL1 | DBGDTRTXext |
| OSECCR | OS Lock Exception Catch Control Register | OSECCR_EL1 | DBGOSECCR |
| OSLAR | OS Lock Access Register | OSLAR_EL1 | DBGOSLAR |
| OSLSR | OS Lock Status Register | OSLSR_EL1 | DBGOSLSR |
| SCR | Secure Configuration Register | SCR_EL3 | SCR |
| SCTLR | System Control Register | SCTLR_EL1<br>SCTLR_EL2<br>SCTLR_EL3 | SCTLR (NS)<br>HSCTLR<br>SCTLR (S) |
| SDCR | Secure or EL3 Debug Configuration Register | MDCR_EL3 | SDCR |
| SDER | Secure Debug Enable Register | SDER32_EL3 | SDER |
| SPSR | Saved Program Status Register | SPSR_EL1<br>SPSR_EL2<br>SPSR_EL3 | SPSR (general description)<br>SPSR_abt<br>SPSR_fiq<br>SPSR_hyp<br>SPSR_irq<br>SPSR_mon<br>SPSR_svc<br>SPSR_und |
| TCR | Translation Control Register | TCR_EL1<br>TCR_EL2<br>TCR_EL3<br>VTCR_EL2 | TTBCR(NS)<br>HTCR<br>TTBCR(S)<br>VTCR |
| TTBR | Translation Table Base Register | TTBR0_EL1<br>TTBR0_EL2<br>TTBR0_EL3<br>TTBR1_EL1<br>VTTBR_EL2 | TTBR0<br>TTBR1<br>HTTBR<br>VTTBR |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**Table K13-1 Disambiguation of general names of registers by Execution state (continued)**

| General name | Short description | AArch64 register | AArch32 register |
|---|---|---|---|
| VCR | PL1&0 stage 2 Translation Control Register | VTCR_EL2 | VTCR |
| VBAR | Vector Base Address Register | VBAR_EL1<br>VBAR_EL2<br>VBAR_EL3 | VBAR<br>HVBAR<br>MVBAR |
| VTTBR | PL1&0 stage 2 Translation Table Base Register | VTTBR_EL2 | VTTBR |

Table K13-2 disambiguates the general names of the System registers that provide access to the Performance Monitors by Execution state.

**Table K13-2 Disambiguation of general names of the Performance Monitors System registers by Execution state**

| General name | Short description | AArch64 register | AArch32 register |
|---|---|---|---|
| PMCCFILTR | Cycle Count Filter Register | PMCCFILTR_EL0 | PMCCFILTR |
| PMCCNTR | Cycle Count Register | PMCCNTR_EL0 | PMCCNTR |
| PMCEID0 | Performance Monitors Cycle Count Filter Register 0 | PMCEID0_EL0 | PMCEID0 |
| PMCEID1 | Performance Monitors Cycle Count Filter Register 1 | PMCEID1_EL0 | PMCEID1 |
| PMCNTENCLR | Performance Monitors Count Enable Clear register | PMCNTENCLR_EL0 | PMINTENCLR |
| PMCNTENSET | Performance Monitors Count Enable Set register | PMCNTENSET_EL0 | PMCNTENSET |
| PMCR | Performance Monitors Control Register | PMCR_EL0 | PMCR |
| PMEVCNTR<n> | Performance Monitors Event Count Registers, n = 0-30 | PMEVCNTR<n>_EL0 | PMEVCNTR<n> |
| PMEVTYPER<n> | Performance Monitors Event Type Registers, n = 0-30 | PMEVTYPER<n>_EL0 | PMEVTYPER<n> |
| PMINTENCLR | Performance Monitors Interrupt Enable Clear register | PMINTENCLR_EL1 | PMINTENCLR |
| PMINTENSET | Performance Monitors Interrupt Enable Set register | PMINTENSET_EL1 | PMINTENSET |
| PMOVSCLR | Performance Monitors Overflow Flag Status Register | PMOVSCLR_EL0 | PMOVSR |
| PMOVSSET | Performance Monitors Overflow Flag Status Set register | PMOVSSET_EL0 | PMOVSSET |
| PMSELR | Performance Monitors Event Counter Selection Register | PMSELR_EL0 | PMSELR |
| PMSWINC | Performance Monitors Software Increment register | PMSWINC_EL0 | PMSWINC |
| PMUSERENR | Performance Monitors User Enable Register | PMUSERENR_EL0 | PMUSERENR |
| PMXEVCNTR | Performance Monitors Selected Event Count Register | PMXEVCNTR_EL0 | PMXEVCNTR |
| PMXEVTYPER | Performance Monitors Selected Event Type Register | PMXEVTYPER_EL0 | PMXEVTYPER |

*Non-Confidential - Beta*

Table K13-3 disambiguates the general names of the System registers that provide access to the Performance Monitors by Execution state.

**Table K13-3 Disambiguation of general names of the Generic Timer System registers by Execution state**

| General name | Short description | AArch64 register | AArch32 register |
|---|---|---|---|
| CNTFRQ | Counter-timer Frequency register | CNTFRQ_EL0 | CNTFRQ |
| CNTHCTL | Counter-timer Hypervisor Control register | CNTHCTL_EL2 | CNTHCTL |
| CNTHP_CTL | Counter-timer Hypervisor Physical Timer Control register | CNTHP_CTL_EL2 | CNTHP_CTL |
| CNTHP_CVAL | Counter-timer Hypervisor Physical Timer CompareValue register | CNTHP_CVAL_EL2 | CNTHP_CVAL |
| CNTHP_TVAL | Counter-timer Hypervisor Physical Timer TimerValue register | CNTHP_TVAL_EL2 | CNTHP_TVAL |
| CNTKCTL | Counter-timer Kernel Control register | CNTKCTL_EL1 | CNTKCTL |
| CNTP_CTL | Counter-timer Physical Timer Control register | CNTP_CTL_EL0 | CNTP_CTL |
| CNTP_CVAL | Counter-timer Physical Timer CompareValue register | CNTP_CVAL_EL0 | CNTP_CVAL |
| CNTP_TVAL | Counter-timer Physical Timer TimerValue register | CNTP_TVAL_EL0 | CNTP_TVAL |
| CNTPCT | Counter-timer Physical Count register | CNTPCT_EL0 | CNTPCT |
| CNTPS_CTL | Counter-timer Physical Secure Timer Control register | CNTPS_CTL_EL1 | - |
| CNTPS_CVAL | Counter-timer Physical Secure Timer CompareValue register | CNTPS_CVAL_EL1 | - |
| CNTPS_TVAL | Counter-timer Physical Secure Timer TimerValue register | CNTPS_TVAL_EL1 | - |
| CNTV_CTL | Counter-timer Virtual Timer Control register | CNTV_CTL_EL0 | CNTV_CTL |
| CNTV_CVAL | Counter-timer Virtual Timer CompareValue register | CNTV_CVAL_EL0 | CNTV_CVAL |
| CNTV_TVAL | Counter-timer Virtual Timer TimerValue register | CNTV_TVAL_EL0 | CNTV_TVAL |
| CNTVCT | Counter-timer Virtual Count register | CNTVCT_EL0 | CNTVCT |
| CNTVOFF | Counter-timer Virtual Offset register | CNTVOFF_EL2 | CNTVOFF |

### K13.1.2 Register name disambiguation by Exception level

Table K13-4 disambiguates the general names of the AArch64 System registers by Exception level.

**Table K13-4 Disambiguation of AArch64 System registers by Exception level**

| General form | EL0 | EL1 | EL2 | EL3 |
|---|---|---|---|---|
| AFSR0_ELx | - | AFSR0_EL1 | AFSR0_EL2 | AFSR0_EL3 |
| AFSR1_ELx | - | AFSR1_EL1 | AFSR1_EL2 | AFSR1_EL3 |
| CPTR_ELx | - | - | CPTR_EL2 | CPTR_EL3 |
| ELR_ELx | - | ELR_EL1 | ELR_EL2 | ELR_EL3 |
| ESR_ELx | - | ESR_EL1 | ESR_EL2 | ESR_EL3 |
| FAR_ELx | - | FAR_EL1 | FAR_EL2 | FAR_EL3 |

## K13.3 Functional index of AArch64 registers and system instructions

This section is an index of the AArch64 registers and system instructions, divided by functional group.

### K13.3.1 Special-purpose registers

This section is an index to the registers in the Special-purpose registers functional group.

**Table K13-6 Special-purpose registers**

| Register | Description, see |
|---|---|
| DLR_EL0 | *DLR_EL0, Debug Link Register* on page D7-2198 |
| DSPSR_EL0 | *DSPSR_EL0, Debug Saved Program Status Register* on page D7-2199 |
| ELR_EL1 | *ELR_EL1, Exception Link Register (EL1)* on page C5-296 |
| ELR_EL2 | *ELR_EL2, Exception Link Register (EL2)* on page C5-297 |
| ELR_EL3 | *ELR_EL3, Exception Link Register (EL3)* on page C5-298 |
| FPCR | *FPCR, Floating-point Control Register* on page C5-299 |
| FPSR | *FPSR, Floating-point Status Register* on page C5-303 |
| SP_EL0 | *SP_EL0, Stack Pointer (EL0)* on page C5-308 |
| SP_EL1 | *SP_EL1, Stack Pointer (EL1)* on page C5-309 |
| SP_EL2 | *SP_EL2, Stack Pointer (EL2)* on page C5-311 |
| SP_EL3 | *SP_EL3, Stack Pointer (EL3)* on page C5-313 |
| SPSR_abt | *SPSR_abt, Saved Program Status Register (Abort mode)* on page C5-315 |
| SPSR_EL1 | *SPSR_EL1, Saved Program Status Register (EL1)* on page C5-318 |
| SPSR_EL2 | *SPSR_EL2, Saved Program Status Register (EL2)* on page C5-323 |
| SPSR_EL3 | *SPSR_EL3, Saved Program Status Register (EL3)* on page C5-328 |
| SPSR_fiq | *SPSR_fiq, Saved Program Status Register (FIQ mode)* on page C5-333 |
| SPSR_irq | *SPSR_irq, Saved Program Status Register (IRQ mode)* on page C5-336 |
| SPSR_und | *SPSR_und, Saved Program Status Register (Undefined mode)* on page C5-339 |

### K13.3.2 VMSA-specific registers

This section is an index to the registers in the Virtual memory control registers functional group.

**Table K13-7 VMSA-specific registers**

| Register | Description, see |
|---|---|
| AMAIR_EL1 | *AMAIR_EL1, Auxiliary Memory Attribute Indirection Register (EL1)* on page D7-1924 |
| AMAIR_EL2 | *AMAIR_EL2, Auxiliary Memory Attribute Indirection Register (EL2)* on page D7-1926 |
| AMAIR_EL3 | *AMAIR_EL3, Auxiliary Memory Attribute Indirection Register (EL3)* on page D7-1927 |
| CONTEXTIDR_EL1 | *CONTEXTIDR_EL1, Context ID Register* on page D7-1932 |
| DACR32_EL2 | *DACR32_EL2, Domain Access Control Register* on page D7-1944 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table K13-7 VMSA-specific registers (continued)**

| Register | Description, see |
|---|---|
| MAIR_EL1 | *MAIR_EL1, Memory Attribute Indirection Register (EL1)* on page D7-2075 |
| MAIR_EL2 | *MAIR_EL2, Memory Attribute Indirection Register (EL2)* on page D7-2078 |
| MAIR_EL3 | *MAIR_EL3, Memory Attribute Indirection Register (EL3)* on page D7-2080 |
| TCR_EL1 | *TCR_EL1, Translation Control Register (EL1)* on page D7-2127 |
| TCR_EL2 | *TCR_EL2, Translation Control Register (EL2)* on page D7-2132 |
| TCR_EL3 | *TCR_EL3, Translation Control Register (EL3)* on page D7-2135 |
| TTBR0_EL1 | *TTBR0_EL1, Translation Table Base Register 0 (EL1)* on page D7-2143 |
| TTBR0_EL2 | *TTBR0_EL2, Translation Table Base Register 0 (EL2)* on page D7-2145 |
| TTBR0_EL3 | *TTBR0_EL3, Translation Table Base Register 0 (EL3)* on page D7-2147 |
| TTBR1_EL1 | *TTBR1_EL1, Translation Table Base Register 1* on page D7-2149 |
| VTCR_EL2 | *VTCR_EL2, Virtualization Translation Control Register* on page D7-2160 |
| VTTBR_EL2 | *VTTBR_EL2, Virtualization Translation Table Base Register* on page D7-2163 |

### K13.3.3 ID registers

This section is an index to the registers in the Identification registers functional group.

**Table K13-8 ID registers**

| Register | Description, see |
|---|---|
| AIDR_EL1 | *AIDR_EL1, Auxiliary ID Register* on page D7-1923 |
| CCSIDR_EL1 | *CCSIDR_EL1, Current Cache Size ID Register* on page D7-1928 |
| CLIDR_EL1 | *CLIDR_EL1, Cache Level ID Register* on page D7-1930 |
| CSSELR_EL1 | *CSSELR_EL1, Cache Size Selection Register* on page D7-1940 |
| CTR_EL0 | *CTR_EL0, Cache Type Register* on page D7-1942 |
| DCZID_EL0 | *DCZID_EL0, Data Cache Zero ID register* on page D7-1946 |
| ID_AA64AFR0_EL1 | *ID_AA64AFR0_EL1, AArch64 Auxiliary Feature Register 0* on page D7-2011 |
| ID_AA64AFR1_EL1 | *ID_AA64AFR1_EL1, AArch64 Auxiliary Feature Register 1* on page D7-2013 |
| ID_AA64DFR0_EL1 | *ID_AA64DFR0_EL1, AArch64 Debug Feature Register 0* on page D7-2014 |
| ID_AA64DFR1_EL1 | *ID_AA64DFR1_EL1, AArch64 Debug Feature Register 1* on page D7-2016 |
| ID_AA64ISAR0_EL1 | *ID_AA64ISAR0_EL1, AArch64 Instruction Set Attribute Register 0* on page D7-2017 |
| ID_AA64ISAR1_EL1 | *ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1* on page D7-2019 |
| ID_AA64MMFR0_EL1 | *ID_AA64MMFR0_EL1, AArch64 Memory Model Feature Register 0* on page D7-2020 |
| ID_AA64MMFR1_EL1 | *ID_AA64MMFR1_EL1, AArch64 Memory Model Feature Register 1* on page D7-2023 |
| ID_AA64PFR0_EL1 | *ID_AA64PFR0_EL1, AArch64 Processor Feature Register 0* on page D7-2024 |

| VPIDR_EL2 | *VPIDR_EL2, Virtualization Processor ID Register* on page D7-2158 |

### K13.3.4 Performance monitors registers

This section is an index to the registers in the Performance Monitors registers functional group.

**Table K13-9 Performance monitors registers**

| Register | Description, see |
|---|---|
| PMCCFILTR_EL0 | *PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register* on page D7-2237 |
| PMCCNTR_EL0 | *PMCCNTR_EL0, Performance Monitors Cycle Count Register* on page D7-2239 |
| PMCEID0_EL0 | *PMCEID0_EL0, Performance Monitors Common Event Identification register 0* on page D7-2241 |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**Table K13-9 Performance monitors registers (continued)**

| Register | Description, see |
|---|---|
| PMCEID1_EL0 | *PMCEID1_EL0, Performance Monitors Common Event Identification register 1* on page D7-2243 |
| PMCNTENCLR_EL0 | *PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register* on page D7-2245 |
| PMCNTENSET_EL0 | *PMCNTENSET_EL0, Performance Monitors Count Enable Set register* on page D7-2247 |
| PMCR_EL0 | *PMCR_EL0, Performance Monitors Control Register* on page D7-2249 |
| PMEVCNTR<n>_EL0 | *PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30* on page D7-2253 |
| PMEVTYPER<n>_EL0 | *PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30* on page D7-2255 |
| PMINTENCLR_EL1 | *PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register* on page D7-2258 |
| PMINTENSET_EL1 | *PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register* on page D7-2260 |
| PMOVSCLR_EL0 | *PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear Register* on page D7-2262 |
| PMOVSSET_EL0 | *PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register* on page D7-2264 |
| PMSELR_EL0 | *PMSELR_EL0, Performance Monitors Event Counter Selection Register* on page D7-2266 |
| PMSWINC_EL0 | *PMSWINC_EL0, Performance Monitors Software Increment register* on page D7-2268 |
| PMUSERENR_EL0 | *PMUSERENR_EL0, Performance Monitors User Enable Register* on page D7-2270 |
| PMXEVCNTR_EL0 | *PMXEVCNTR_EL0, Performance Monitors Selected Event Count Register* on page D7-2272 |
| PMXEVTYPER_EL0 | *PMXEVTYPER_EL0, Performance Monitors Selected Event Type Register* on page D7-2274 |

### K13.3.5 Debug registers

This section is an index to the registers in the Debug registers functional group.

**Table K13-10 Debug registers**

| Register | Description, see |
|---|---|
| DBGAUTHSTATUS_EL1 | *DBGAUTHSTATUS_EL1, Debug Authentication Status register* on page D7-2166 |
| DBGBCR<n>_EL1 | *DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15* on page D7-2168 |
| DBGBVR<n>_EL1 | *DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15* on page D7-2172 |
| DBGCLAIMCLR_EL1 | *DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register* on page D7-2175 |
| DBGCLAIMSET_EL1 | *DBGCLAIMSET_EL1, Debug CLAIM Tag Set register* on page D7-2177 |
| DBGDTR_EL0 | *DBGDTR_EL0, Debug Data Transfer Register, half-duplex* on page D7-2179 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table K13-10 Debug registers (continued)**

| Register | Description, see |
|---|---|
| DBGDTRRX_EL0 | *DBGDTRRX_EL0, Debug Data Transfer Register, Receive* on page D7-2181 |
| DBGDTRTX_EL0 | *DBGDTRTX_EL0, Debug Data Transfer Register, Transmit* on page D7-2183 |
| DBGPRCR_EL1 | *DBGPRCR_EL1, Debug Power Control Register* on page D7-2185 |
| DBGVCR32_EL2 | *DBGVCR32_EL2, Debug Vector Catch Register* on page D7-2187 |
| DBGWCR<n>_EL1 | *DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15* on page D7-2192 |
| DBGWVR<n>_EL1 | *DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15* on page D7-2196 |
| DLR_EL0 | *DLR_EL0, Debug Link Register* on page D7-2198 |
| DSPSR_EL0 | *DSPSR_EL0, Debug Saved Program Status Register* on page D7-2199 |
| MDCCINT_EL1 | *MDCCINT_EL1, Monitor DCC Interrupt Enable Register* on page D7-2204 |
| MDCCSR_EL0 | *MDCCSR_EL0, Monitor DCC Status Register* on page D7-2206 |
| MDCR_EL2 | *MDCR_EL2, Monitor Debug Configuration Register (EL2)* on page D7-2208 |
| MDCR_EL3 | *MDCR_EL3, Monitor Debug Configuration Register (EL3)* on page D7-2212 |
| MDRAR_EL1 | *MDRAR_EL1, Monitor Debug ROM Address Register* on page D7-2216 |
| MDSCR_EL1 | *MDSCR_EL1, Monitor Debug System Control Register* on page D7-2218 |
| OSDLR_EL1 | *OSDLR_EL1, OS Double Lock Register* on page D7-2222 |
| OSDTRRX_EL1 | *OSDTRRX_EL1, OS Lock Data Transfer Register, Receive* on page D7-2224 |
| OSDTRTX_EL1 | *OSDTRTX_EL1, OS Lock Data Transfer Register, Transmit* on page D7-2226 |
| OSECCR_EL1 | *OSECCR_EL1, OS Lock Exception Catch Control Register* on page D7-2228 |
| OSLAR_EL1 | *OSLAR_EL1, OS Lock Access Register* on page D7-2230 |
| OSLSR_EL1 | *OSLSR_EL1, OS Lock Status Register* on page D7-2232 |
| SDER32_EL3 | *SDER32_EL3, AArch32 Secure Debug Enable Register* on page D7-2234 |

### K13.3.6 Generic timer registers

This section is an index to the registers in the Generic Timer registers functional group.

**Table K13-11 Generic timer registers**

| Register | Description, see |
|---|---|
| CNTFRQ_EL0 | *CNTFRQ_EL0, Counter-timer Frequency register* on page D7-2277 |
| CNTHCTL_EL2 | *CNTHCTL_EL2, Counter-timer Hypervisor Control register* on page D7-2279 |
| CNTHP_CTL_EL2 | *CNTHP_CTL_EL2, Counter-timer Hypervisor Physical Timer Control register* on page D7-2281 |
| CNTHP_CVAL_EL2 | *CNTHP_CVAL_EL2, Counter-timer Hypervisor Physical Timer CompareValue register* on page D7-2283 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table K13-11 Generic timer registers (continued)**

| Register | Description, see |
|---|---|
| CNTHP_TVAL_EL2 | *CNTHP_TVAL_EL2, Counter-timer Hypervisor Physical Timer TimerValue register* on page D7-2284 |
| CNTKCTL_EL1 | *CNTKCTL_EL1, Counter-timer Kernel Control register* on page D7-2285 |
| CNTP_CTL_EL0 | *CNTP_CTL_EL0, Counter-timer Physical Timer Control register* on page D7-2288 |
| CNTP_CVAL_EL0 | *CNTP_CVAL_EL0, Counter-timer Physical Timer CompareValue register* on page D7-2290 |
| CNTP_TVAL_EL0 | *CNTP_TVAL_EL0, Counter-timer Physical Timer TimerValue register* on page D7-2291 |
| CNTPCT_EL0 | *CNTPCT_EL0, Counter-timer Physical Count register* on page D7-2293 |
| CNTPS_CTL_EL1 | *CNTPS_CTL_EL1, Counter-timer Physical Secure Timer Control register* on page D7-2294 |
| CNTPS_CVAL_EL1 | *CNTPS_CVAL_EL1, Counter-timer Physical Secure Timer CompareValue register* on page D7-2296 |
| CNTPS_TVAL_EL1 | *CNTPS_TVAL_EL1, Counter-timer Physical Secure Timer TimerValue register* on page D7-2297 |
| CNTV_CTL_EL0 | *CNTV_CTL_EL0, Counter-timer Virtual Timer Control register* on page D7-2299 |
| CNTV_CVAL_EL0 | *CNTV_CVAL_EL0, Counter-timer Virtual Timer CompareValue register* on page D7-2301 |
| CNTV_TVAL_EL0 | *CNTV_TVAL_EL0, Counter-timer Virtual Timer TimerValue register* on page D7-2302 |
| CNTVCT_EL0 | *CNTVCT_EL0, Counter-timer Virtual Count register* on page D7-2304 |
| CNTVOFF_EL2 | *CNTVOFF_EL2, Counter-timer Virtual Offset register* on page D7-2305 |

### K13.3.7 Cache maintenance system instructions

This section is an index to the registers in the Cache maintenance instructions functional group.

**Table K13-12 Cache maintenance system instructions**

| Register | Description, see |
|---|---|
| DC CISW | *DC CISW, Data or unified Cache line Clean and Invalidate by Set/Way* on page C5-343 |
| DC CIVAC | *DC CIVAC, Data or unified Cache line Clean and Invalidate by VA to PoC* on page C5-345 |
| DC CSW | *DC CSW, Data or unified Cache line Clean by Set/Way* on page C5-346 |
| DC CVAC | *DC CVAC, Data or unified Cache line Clean by VA to PoC* on page C5-348 |
| DC CVAU | *DC CVAU, Data or unified Cache line Clean by VA to PoU* on page C5-349 |
| DC ISW | *DC ISW, Data or unified Cache line Invalidate by Set/Way* on page C5-350 |
| DC IVAC | *DC IVAC, Data or unified Cache line Invalidate by VA to PoC* on page C5-352 |
| DC ZVA | *DC ZVA, Data Cache Zero by VA* on page C5-353 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table K13-12 Cache maintenance system instructions (continued)**

| Register | Description, see |
|---|---|
| IC IALLU | *IC IALLU, Instruction Cache Invalidate All to PoU* on page C5-355 |
| IC IALLUIS | *IC IALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable* on page C5-356 |
| IC IVAU | *IC IVAU, Instruction Cache line Invalidate by VA to PoU* on page C5-357 |

### K13.3.8 Address translation system instructions

This section is an index to the registers in the Address translation instructions functional group.

**Table K13-13 Address translation system instructions**

| Register | Description, see |
|---|---|
| AT S12E0R | *AT S12E0R, Address Translate Stages 1 and 2 EL0 Read* on page C5-359 |
| AT S12E0W | *AT S12E0W, Address Translate Stages 1 and 2 EL0 Write* on page C5-360 |
| AT S12E1R | *AT S12E1R, Address Translate Stages 1 and 2 EL1 Read* on page C5-361 |
| AT S12E1W | *AT S12E1W, Address Translate Stages 1 and 2 EL1 Write* on page C5-362 |
| AT S1E0R | *AT S1E0R, Address Translate Stage 1 EL0 Read* on page C5-363 |
| AT S1E0W | *AT S1E0W, Address Translate Stage 1 EL0 Write* on page C5-364 |
| AT S1E1R | *AT S1E1R, Address Translate Stage 1 EL1 Read* on page C5-365 |
| AT S1E1W | *AT S1E1W, Address Translate Stage 1 EL1 Write* on page C5-366 |
| AT S1E2R | *AT S1E2R, Address Translate Stage 1 EL2 Read* on page C5-367 |
| AT S1E2W | *AT S1E2W, Address Translate Stage 1 EL2 Write* on page C5-368 |
| AT S1E3R | *AT S1E3R, Address Translate Stage 1 EL3 Read* on page C5-369 |
| AT S1E3W | *AT S1E3W, Address Translate Stage 1 EL3 Write* on page C5-370 |

### K13.3.9 TLB maintenance system instructions

This section is an index to the registers in the TLB maintenance instructions functional group.

**Table K13-14 TLB maintenance system instructions**

| Register | Description, see |
|---|---|
| TLBI ALLE1 | *TLBI ALLE1, TLB Invalidate All, EL1* on page C5-372 |
| TLBI ALLE1IS | *TLBI ALLE1IS, TLB Invalidate All, EL1, Inner Shareable* on page C5-373 |
| TLBI ALLE2 | *TLBI ALLE2, TLB Invalidate All, EL2* on page C5-374 |
| TLBI ALLE2IS | *TLBI ALLE2IS, TLB Invalidate All, EL2, Inner Shareable* on page C5-375 |
| TLBI ALLE3 | *TLBI ALLE3, TLB Invalidate All, EL3* on page C5-376 |
| TLBI ALLE3IS | *TLBI ALLE3IS, TLB Invalidate All, EL3, Inner Shareable* on page C5-377 |
| TLBI ASIDE1 | *TLBI ASIDE1, TLB Invalidate by ASID, EL1* on page C5-378 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table K13-14 TLB maintenance system instructions (continued)**

| Register | Description, see |
|---|---|
| TLBI ASIDE1IS | *TLBI ASIDE1IS, TLB Invalidate by ASID, EL1, Inner Shareable* on page C5-380 |
| TLBI IPAS2E1 | *TLBI IPAS2E1, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1* on page C5-382 |
| TLBI IPAS2E1IS | *TLBI IPAS2E1IS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable* on page C5-383 |
| TLBI IPAS2LE1 | *TLBI IPAS2LE1, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1* on page C5-385 |
| TLBI IPAS2LE1IS | *TLBI IPAS2LE1IS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable* on page C5-386 |
| TLBI VAAE1 | *TLBI VAAE1, TLB Invalidate by VA, All ASID, EL1* on page C5-388 |
| TLBI VAAE1IS | *TLBI VAAE1IS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable* on page C5-390 |
| TLBI VAALE1 | *TLBI VAALE1, TLB Invalidate by VA, All ASID, Last level, EL1* on page C5-392 |
| TLBI VAALE1IS | *TLBI VAALE1IS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable* on page C5-394 |
| TLBI VAE1 | *TLBI VAE1, TLB Invalidate by VA, EL1* on page C5-396 |
| TLBI VAE1IS | *TLBI VAE1IS, TLB Invalidate by VA, EL1, Inner Shareable* on page C5-398 |
| TLBI VAE2 | *TLBI VAE2, TLB Invalidate by VA, EL2* on page C5-400 |
| TLBI VAE2IS | *TLBI VAE2IS, TLB Invalidate by VA, EL2, Inner Shareable* on page C5-402 |
| TLBI VAE3 | *TLBI VAE3, TLB Invalidate by VA, EL3* on page C5-404 |
| TLBI VAE3IS | *TLBI VAE3IS, TLB Invalidate by VA, EL3, Inner Shareable* on page C5-406 |
| TLBI VALE1 | *TLBI VALE1, TLB Invalidate by VA, Last level, EL1* on page C5-408 |
| TLBI VALE1IS | *TLBI VALE1IS, TLB Invalidate by VA, Last level, EL1, Inner Shareable* on page C5-410 |
| TLBI VALE2 | *TLBI VALE2, TLB Invalidate by VA, Last level, EL2* on page C5-412 |
| TLBI VALE2IS | *TLBI VALE2IS, TLB Invalidate by VA, Last level, EL2, Inner Shareable* on page C5-414 |
| TLBI VALE3 | *TLBI VALE3, TLB Invalidate by VA, Last level, EL3* on page C5-416 |
| TLBI VALE3IS | *TLBI VALE3IS, TLB Invalidate by VA, Last level, EL3, Inner Shareable* on page C5-418 |
| TLBI VMALLE1 | *TLBI VMALLE1, TLB Invalidate by VMID, All at stage 1, EL1* on page C5-420 |
| TLBI VMALLE1IS | *TLBI VMALLE1IS, TLB Invalidate by VMID, All at stage 1, EL1, Inner Shareable* on page C5-421 |
| TLBI VMALLS12E1 | *TLBI VMALLS12E1, TLB Invalidate by VMID, All at Stage 1 and 2, EL1* on page C5-422 |
| TLBI VMALLS12E1IS | *TLBI VMALLS12E1IS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Inner Shareable* on page C5-423 |

### K13.3.10 Base System registers

This section is an index to the registers in the functional group.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table K13-15 Base System registers**

| Register | Description, see |
|---|---|
| ACTLR_EL1 | *ACTLR_EL1, Auxiliary Control Register (EL1)* on page D7-1914 |
| ACTLR_EL2 | *ACTLR_EL2, Auxiliary Control Register (EL2)* on page D7-1915 |
| ACTLR_EL3 | *ACTLR_EL3, Auxiliary Control Register (EL3)* on page D7-1916 |
| AFSR0_EL1 | *AFSR0_EL1, Auxiliary Fault Status Register 0 (EL1)* on page D7-1917 |
| AFSR0_EL2 | *AFSR0_EL2, Auxiliary Fault Status Register 0 (EL2)* on page D7-1918 |
| AFSR0_EL3 | *AFSR0_EL3, Auxiliary Fault Status Register 0 (EL3)* on page D7-1919 |
| AFSR1_EL1 | *AFSR1_EL1, Auxiliary Fault Status Register 1 (EL1)* on page D7-1920 |
| AFSR1_EL2 | *AFSR1_EL2, Auxiliary Fault Status Register 1 (EL2)* on page D7-1921 |
| AFSR1_EL3 | *AFSR1_EL3, Auxiliary Fault Status Register 1 (EL3)* on page D7-1922 |
| CPACR_EL1 | *CPACR_EL1, Architectural Feature Access Control Register* on page D7-1934 |
| CPTR_EL2 | *CPTR_EL2, Architectural Feature Trap Register (EL2)* on page D7-1936 |
| CPTR_EL3 | *CPTR_EL3, Architectural Feature Trap Register (EL3)* on page D7-1938 |
| CurrentEL | *CurrentEL, Current Exception Level* on page C5-290 |
| DAIF | *DAIF, Interrupt Mask Bits* on page C5-292 |
| ESR_EL1 | *ESR_EL1, Exception Syndrome Register (EL1)* on page D7-1948 |
| ESR_EL2 | *ESR_EL2, Exception Syndrome Register (EL2)* on page D7-1949 |
| ESR_EL3 | *ESR_EL3, Exception Syndrome Register (EL3)* on page D7-1950 |
| ESR_ELx | *ESR_ELx, Exception Syndrome Register (ELx)* on page D7-1951 |
| FAR_EL1 | *FAR_EL1, Fault Address Register (EL1)* on page D7-1983 |
| FAR_EL2 | *FAR_EL2, Fault Address Register (EL2)* on page D7-1985 |
| FAR_EL3 | *FAR_EL3, Fault Address Register (EL3)* on page D7-1987 |
| FPEXC32_EL2 | *FPEXC32_EL2, Floating-Point Exception Control register* on page D7-1989 |
| HACR_EL2 | *HACR_EL2, Hypervisor Auxiliary Control Register* on page D7-1994 |
| HCR_EL2 | *HCR_EL2, Hypervisor Configuration Register* on page D7-1995 |
| HPFAR_EL2 | *HPFAR_EL2, Hypervisor IPA Fault Address Register* on page D7-2007 |
| HSTR_EL2 | *HSTR_EL2, Hypervisor System Trap Register* on page D7-2009 |
| IFSR32_EL2 | *IFSR32_EL2, Instruction Fault Status Register (EL2)* on page D7-2069 |
| ISR_EL1 | *ISR_EL1, Interrupt Status Register* on page D7-2073 |
| NZCV | *NZCV, Condition Flags* on page C5-306 |
| PAR_EL1 | *PAR_EL1, Physical Address Register* on page D7-2094 |
| RMR_EL1 | *RMR_EL1, Reset Management Register (if EL2 and EL3 not implemented)* on page D7-2098 |
| RMR_EL2 | *RMR_EL2, Reset Management Register (if EL3 not implemented)* on page D7-2100 |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*

## K13.4 Alphabetical index of AArch32 registers and system instructions

This section is an index of AArch32 registers and system instructions in alphabetical order.

**Table K13-16 Alphabetical index of AArch32 Registers**

| Register | Description, see |
|---|---|
| ACTLR | *ACTLR, Auxiliary Control Register* on page G6-4214 |
| ACTLR2 | *ACTLR2, Auxiliary Control Register 2* on page G6-4216 |
| ADFSR | *ADFSR, Auxiliary Data Fault Status Register* on page G6-4218 |
| AIDR | *AIDR, Auxiliary ID Register* on page G6-4220 |
| AIFSR | *AIFSR, Auxiliary Instruction Fault Status Register* on page G6-4222 |
| AMAIR0 | *AMAIR0, Auxiliary Memory Attribute Indirection Register 0* on page G6-4224 |
| AMAIR1 | *AMAIR1, Auxiliary Memory Attribute Indirection Register 1* on page G6-4226 |
| APSR | *APSR, Application Program Status Register* on page G6-4228 |
| ATS12NSOPR | *ATS12NSOPR, Address Translate Stages 1 and 2 Non-secure Only PL1 Read* on page G6-4230 |

## K13.5 Functional index of AArch32 registers and system instructions

This section is an index of the AArch32 registers and system instructions, divided by functional group. Each of the following sections lists the registers for a functional group:

- *Special-purpose registers*.
- *VMSA-specific registers* on page K13-5741.
- *ID registers* on page K13-5741.
- *Performance monitors registers* on page K13-5743.
- *Debug registers* on page K13-5743.
- *Generic timer registers* on page K13-5745.
- *Cache maintenance system instructions* on page K13-5745.
- *Address translation system instructions* on page K13-5746.
- *TLB maintenance system instructions* on page K13-5746.
- *Legacy feature registers and system instructions* on page K13-5748.
- *Base System registers* on page K13-5748.

### K13.5.1 Special-purpose registers

This section is an index to the registers in the Processor state registers functional group.

**Table K13-17 Special-purpose registers**

| Register | Description, see |
|---|---|
| DLR | *DLR, Debug Link Register* on page G6-4722 |
| DSPSR | *DSPSR, Debug Saved Program Status Register* on page G6-4724 |
| ELR_hyp | *ELR_hyp, Exception Link Register (Hyp mode)* on page G6-4308 |
| FPSCR | *FPSCR, Floating-Point Status and Control Register* on page G6-4317 |
| SPSR | *SPSR, Saved Program Status Register* on page G6-4534 |
| SPSR_abt | *SPSR_abt, Saved Program Status Register (Abort mode)* on page G6-4537 |
| SPSR_fiq | *SPSR_fiq, Saved Program Status Register (FIQ mode)* on page G6-4541 |
| SPSR_hyp | *SPSR_hyp, Saved Program Status Register (Hyp mode)* on page G6-4545 |
| SPSR_irq | *SPSR_irq, Saved Program Status Register (IRQ mode)* on page G6-4549 |
| SPSR_mon | *SPSR_mon, Saved Program Status Register (Monitor mode)* on page G6-4553 |
| SPSR_svc | *SPSR_svc, Saved Program Status Register (Sup. Call mode)* on page G6-4557 |
| SPSR_und | *SPSR_und, Saved Program Status Register (Undefined mode)* on page G6-4561 |

Non-Confidential - Beta

### K13.5.2 VMSA-specific registers

This section is an index to the registers in the Virtual memory control registers functional group.

**Table K13-18 VMSA-specific registers**

| Register | Description, see |
|---|---|
| AMAIR0 | *AMAIR0, Auxiliary Memory Attribute Indirection Register 0* on page G6-4224 |
| AMAIR1 | *AMAIR1, Auxiliary Memory Attribute Indirection Register 1* on page G6-4226 |
| CONTEXTIDR | *CONTEXTIDR, Context ID Register* on page G6-4259 |
| DACR | *DACR, Domain Access Control Register* on page G6-4278 |
| HAMAIR0 | *HAMAIR0, Hyp Auxiliary Memory Attribute Indirection Register 0* on page G6-4336 |
| HAMAIR1 | *HAMAIR1, Hyp Auxiliary Memory Attribute Indirection Register 1* on page G6-4338 |
| HMAIR0 | *HMAIR0, Hyp Memory Attribute Indirection Register 0* on page G6-4361 |
| HMAIR1 | *HMAIR1, Hyp Memory Attribute Indirection Register 1* on page G6-4364 |
| HTCR | *HTCR, Hyp Translation Control Register* on page G6-4397 |
| HTTBR | *HTTBR, Hyp Translation Table Base Register* on page G6-4402 |
| MAIR0 | *MAIR0, Memory Attribute Indirection Register 0* on page G6-4475 |
| MAIR1 | *MAIR1, Memory Attribute Indirection Register 1* on page G6-4478 |
| NMRR | *NMRR, Normal Memory Remap Register* on page G6-4497 |
| PRRR | *PRRR, Primary Region Remap Register* on page G6-4511 |
| TTBCR | *TTBCR, Translation Table Base Control Register* on page G6-4623 |
| TTBR0 | *TTBR0, Translation Table Base Register 0* on page G6-4628 |
| TTBR1 | *TTBR1, Translation Table Base Register 1* on page G6-4632 |
| VTCR | *VTCR, Virtualization Translation Control Register* on page G6-4643 |
| VTTBR | *VTTBR, Virtualization Translation Table Base Register* on page G6-4646 |

### K13.5.3 ID registers

This section is an index to the registers in the Identification registers functional group.

**Table K13-19 ID registers**

| Register | Description, see |
|---|---|
| AIDR | *AIDR, Auxiliary ID Register* on page G6-4220 |
| CCSIDR | *CCSIDR, Current Cache Size ID Register* on page G6-4254 |
| CLIDR | *CLIDR, Cache Level ID Register* on page G6-4257 |
| CSSELR | *CSSELR, Cache Size Selection Register* on page G6-4274 |
| CTR | *CTR, Cache Type Register* on page G6-4276 |
| FPSID | *FPSID, Floating-Point System ID register* on page G6-4323 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table K13-19 ID registers (continued)**

| Register | Description, see |
|---|---|
| ID_AFR0 | *ID_AFR0, Auxiliary Feature Register 0* on page G6-4412 |
| ID_DFR0 | *ID_DFR0, Debug Feature Register 0* on page G6-4414 |
| ID_ISAR0 | *ID_ISAR0, Instruction Set Attribute Register 0* on page G6-4417 |
| ID_ISAR1 | *ID_ISAR1, Instruction Set Attribute Register 1* on page G6-4420 |
| ID_ISAR2 | *ID_ISAR2, Instruction Set Attribute Register 2* on page G6-4423 |
| ID_ISAR3 | *ID_ISAR3, Instruction Set Attribute Register 3* on page G6-4426 |
| ID_ISAR4 | *ID_ISAR4, Instruction Set Attribute Register 4* on page G6-4429 |
| ID_ISAR5 | *ID_ISAR5, Instruction Set Attribute Register 5* on page G6-4432 |
| ID_MMFR0 | *ID_MMFR0, Memory Model Feature Register 0* on page G6-4434 |
| ID_MMFR1 | *ID_MMFR1, Memory Model Feature Register 1* on page G6-4437 |
| ID_MMFR2 | *ID_MMFR2, Memory Model Feature Register 2* on page G6-4441 |
| ID_MMFR3 | *ID_MMFR3, Memory Model Feature Register 3* on page G6-4445 |
| ID_MMFR4 | *ID_MMFR4, Memory Model Feature Register 4* on page G6-4448 |
| ID_PFR0 | *ID_PFR0, Processor Feature Register 0* on page G6-4450 |
| ID_PFR1 | *ID_PFR1, Processor Feature Register 1* on page G6-4452 |
| MIDR | *MIDR, Main ID Register* on page G6-4481 |
| MPIDR | *MPIDR, Multiprocessor Affinity Register* on page G6-4484 |
| MVFR0 | *MVFR0, Media and VFP Feature Register 0* on page G6-4488 |
| MVFR1 | *MVFR1, Media and VFP Feature Register 1* on page G6-4492 |
| MVFR2 | *MVFR2, Media and VFP Feature Register 2* on page G6-4495 |
| REVIDR | *REVIDR, Revision ID Register* on page G6-4514 |
| TCMTR | *TCMTR, TCM Type Register* on page G6-4565 |
| TLBTR | *TLBTR, TLB Type Register* on page G6-4615 |
| VMPIDR | *VMPIDR, Virtualization Multiprocessor ID Register* on page G6-4638 |
| VPIDR | *VPIDR, Virtualization Processor ID Register* on page G6-4640 |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### K13.5.4 Performance monitors registers

This section is an index to the registers in the Performance Monitors registers functional group.

**Table K13-20 Performance monitors registers**

| Register | Description, see |
|---|---|
| PMCCFILTR | *PMCCFILTR, Performance Monitors Cycle Count Filter Register* on page G6-4738 |
| PMCCNTR | *PMCCNTR, Performance Monitors Cycle Count Register* on page G6-4741 |
| PMCEID0 | *PMCEID0, Performance Monitors Common Event Identification register 0* on page G6-4744 |
| PMCEID1 | *PMCEID1, Performance Monitors Common Event Identification register 1* on page G6-4746 |
| PMCNTENCLR | *PMCNTENCLR, Performance Monitors Count Enable Clear register* on page G6-4748 |
| PMCNTENSET | *PMCNTENSET, Performance Monitors Count Enable Set register* on page G6-4750 |
| PMCR | *PMCR, Performance Monitors Control Register* on page G6-4752 |
| PMEVCNTR<n> | *PMEVCNTR<n>, Performance Monitors Event Count Registers, n = 0 - 30* on page G6-4756 |
| PMEVTYPER<n> | *PMEVTYPER<n>, Performance Monitors Event Type Registers, n = 0 - 30* on page G6-4758 |
| PMINTENCLR | *PMINTENCLR, Performance Monitors Interrupt Enable Clear register* on page G6-4761 |
| PMINTENSET | *PMINTENSET, Performance Monitors Interrupt Enable Set register* on page G6-4763 |
| PMOVSR | *PMOVSR, Performance Monitors Overflow Flag Status Register* on page G6-4765 |
| PMOVSSET | *PMOVSSET, Performance Monitors Overflow Flag Status Set register* on page G6-4767 |
| PMSELR | *PMSELR, Performance Monitors Event Counter Selection Register* on page G6-4769 |
| PMSWINC | *PMSWINC, Performance Monitors Software Increment register* on page G6-4771 |
| PMUSERENR | *PMUSERENR, Performance Monitors User Enable Register* on page G6-4773 |
| PMXEVCNTR | *PMXEVCNTR, Performance Monitors Selected Event Count Register* on page G6-4776 |
| PMXEVTYPER | *PMXEVTYPER, Performance Monitors Selected Event Type Register* on page G6-4778 |

### K13.5.5 Debug registers

This section is an index to the registers in the Debug registers functional group.

**Table K13-21 Debug registers**

| Register | Description, see |
|---|---|
| DBGAUTHSTATUS | *DBGAUTHSTATUS, Debug Authentication Status register* on page G6-4649 |
| DBGBCR<n> | *DBGBCR<n>, Debug Breakpoint Control Registers, n = 0 - 15* on page G6-4651 |
| DBGBVR<n> | *DBGBVR<n>, Debug Breakpoint Value Registers, n = 0 - 15* on page G6-4655 |
| DBGBXVR<n> | *DBGBXVR<n>, Debug Breakpoint Extended Value Registers, n = 0 - 15* on page G6-4658 |
| DBGCLAIMCLR | *DBGCLAIMCLR, Debug CLAIM Tag Clear register* on page G6-4660 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table K13-21 Debug registers (continued)**

| Register | Description, see |
|---|---|
| DBGCLAIMSET | *DBGCLAIMSET, Debug CLAIM Tag Set register* on page G6-4662 |
| DBGDCCINT | *DBGDCCINT, DCC Interrupt Enable Register* on page G6-4664 |
| DBGDEVID | *DBGDEVID, Debug Device ID register 0* on page G6-4666 |
| DBGDEVID1 | *DBGDEVID1, Debug Device ID register 1* on page G6-4669 |
| DBGDEVID2 | *DBGDEVID2, Debug Device ID register 2* on page G6-4671 |
| DBGDIDR | *DBGDIDR, Debug ID Register* on page G6-4673 |
| DBGDRAR | *DBGDRAR, Debug ROM Address Register* on page G6-4676 |
| DBGDSAR | *DBGDSAR, Debug Self Address Register* on page G6-4679 |
| DBGDSCRext | *DBGDSCRext, Debug Status and Control Register, External View* on page G6-4681 |
| DBGDSCRint | *DBGDSCRint, Debug Status and Control Register, Internal View* on page G6-4685 |
| DBGDTRRXext | *DBGDTRRXext, Debug OS Lock Data Transfer Register, Receive, External View* on page G6-4688 |
| DBGDTRRXint | *DBGDTRRXint, Debug Data Transfer Register, Receive* on page G6-4690 |
| DBGDTRTXext | *DBGDTRTXext, Debug OS Lock Data Transfer Register, Transmit* on page G6-4692 |
| DBGDTRTXint | *DBGDTRTXint, Debug Data Transfer Register, Transmit* on page G6-4694 |
| DBGOSDLR | *DBGOSDLR, Debug OS Double Lock Register* on page G6-4696 |
| DBGOSECCR | *DBGOSECCR, Debug OS Lock Exception Catch Control Register* on page G6-4698 |
| DBGOSLAR | *DBGOSLAR, Debug OS Lock Access Register* on page G6-4700 |
| DBGOSLSR | *DBGOSLSR, Debug OS Lock Status Register* on page G6-4702 |
| DBGPRCR | *DBGPRCR, Debug Power Control Register* on page G6-4704 |
| DBGVCR | *DBGVCR, Debug Vector Catch Register* on page G6-4706 |
| DBGWCR<n> | *DBGWCR<n>, Debug Watchpoint Control Registers, n = 0 - 15* on page G6-4714 |
| DBGWFAR | *DBGWFAR, Debug Watchpoint Fault Address Register* on page G6-4718 |
| DBGWVR<n> | *DBGWVR<n>, Debug Watchpoint Value Registers, n = 0 - 15* on page G6-4720 |
| DLR | *DLR, Debug Link Register* on page G6-4722 |
| DSPSR | *DSPSR, Debug Saved Program Status Register* on page G6-4724 |
| HDCR | *HDCR, Hyp Debug Control Register* on page G6-4728 |
| SDCR | *SDCR, Secure Debug Configuration Register* on page G6-4732 |
| SDER | *SDER, Secure Debug Enable Register* on page G6-4735 |

Non-Confidential - Beta

### K13.5.6 Generic timer registers

This section is an index to the registers in the Generic Timer registers functional group.

**Table K13-22 Generic timer registers**

| Register | Description, see |
|---|---|
| CNTFRQ | *CNTFRQ, Counter-timer Frequency register* on page G6-4781 |
| CNTHCTL | *CNTHCTL, Counter-timer Hyp Control register* on page G6-4783 |
| CNTHP_CTL | *CNTHP_CTL, Counter-timer Hyp Physical Timer Control register* on page G6-4785 |
| CNTHP_CVAL | *CNTHP_CVAL, Counter-timer Hyp Physical CompareValue register* on page G6-4787 |
| CNTHP_TVAL | *CNTHP_TVAL, Counter-timer Hyp Physical Timer TimerValue register* on page G6-4789 |
| CNTKCTL | *CNTKCTL, Counter-timer Kernel Control register* on page G6-4791 |
| CNTP_CTL | *CNTP_CTL, Counter-timer Physical Timer Control register* on page G6-4794 |
| CNTP_CVAL | *CNTP_CVAL, Counter-timer Physical Timer CompareValue register* on page G6-4797 |
| CNTP_TVAL | *CNTP_TVAL, Counter-timer Physical Timer TimerValue register* on page G6-4799 |
| CNTPCT | *CNTPCT, Counter-timer Physical Count register* on page G6-4801 |
| CNTV_CTL | *CNTV_CTL, Counter-timer Virtual Timer Control register* on page G6-4803 |
| CNTV_CVAL | *CNTV_CVAL, Counter-timer Virtual Timer CompareValue register* on page G6-4805 |
| CNTV_TVAL | *CNTV_TVAL, Counter-timer Virtual Timer TimerValue register* on page G6-4807 |
| CNTVCT | *CNTVCT, Counter-timer Virtual Count register* on page G6-4809 |
| CNTVOFF | *CNTVOFF, Counter-timer Virtual Offset register* on page G6-4811 |

### K13.5.7 Cache maintenance system instructions

This section is an index to the registers in the Cache maintenance instructions functional group.

**Table K13-23 Cache maintenance system instructions**

| Register | Description, see |
|---|---|
| BPIALL | *BPIALL, Branch Predictor Invalidate All* on page G6-4250 |
| BPIALLIS | *BPIALLIS, Branch Predictor Invalidate All, Inner Shareable* on page G6-4251 |
| BPIMVA | *BPIMVA, Branch Predictor Invalidate by VA* on page G6-4252 |
| DCCIMVAC | *DCCIMVAC, Data Cache line Clean and Invalidate by VA to PoC* on page G6-4280 |
| DCCISW | *DCCISW, Data Cache line Clean and Invalidate by Set/Way* on page G6-4282 |
| DCCMVAC | *DCCMVAC, Data Cache line Clean by VA to PoC* on page G6-4284 |
| DCCMVAU | *DCCMVAU, Data Cache line Clean by VA to PoU* on page G6-4286 |
| DCCSW | *DCCSW, Data Cache line Clean by Set/Way* on page G6-4288 |
| DCIMVAC | *DCIMVAC, Data Cache line Invalidate by VA to PoC* on page G6-4290 |
| DCISW | *DCISW, Data Cache line Invalidate by Set/Way* on page G6-4292 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table K13-23 Cache maintenance system instructions (continued)**

| Register | Description, see |
|---|---|
| ICIALLU | *ICIALLU, Instruction Cache Invalidate All to PoU* on page G6-4406 |
| ICIALLUIS | *ICIALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable* on page G6-4408 |
| ICIMVAU | *ICIMVAU, Instruction Cache line Invalidate by VA to PoU* on page G6-4410 |

### K13.5.8 Address translation system instructions

This section is an index to the registers in the Address translation instructions functional group.

**Table K13-24 Address translation system instructions**

| Register | Description, see |
|---|---|
| ATS12NSOPR | *ATS12NSOPR, Address Translate Stages 1 and 2 Non-secure Only PL1 Read* on page G6-4230 |
| ATS12NSOPW | *ATS12NSOPW, Address Translate Stages 1 and 2 Non-secure Only PL1 Write* on page G6-4232 |
| ATS12NSOUR | *ATS12NSOUR, Address Translate Stages 1 and 2 Non-secure Only Unprivileged Read* on page G6-4234 |
| ATS12NSOUW | *ATS12NSOUW, Address Translate Stages 1 and 2 Non-secure Only Unprivileged Write* on page G6-4236 |
| ATS1CPR | *ATS1CPR, Address Translate Stage 1 Current state PL1 Read* on page G6-4238 |
| ATS1CPW | *ATS1CPW, Address Translate Stage 1 Current state PL1 Write* on page G6-4240 |
| ATS1CUR | *ATS1CUR, Address Translate Stage 1 Current state Unprivileged Read* on page G6-4242 |
| ATS1CUW | *ATS1CUW, Address Translate Stage 1 Current state Unprivileged Write* on page G6-4244 |
| ATS1HR | *ATS1HR, Address Translate Stage 1 Hyp mode Read* on page G6-4246 |
| ATS1HW | *ATS1HW, Address Translate Stage 1 Hyp mode Write* on page G6-4248 |

### K13.5.9 TLB maintenance system instructions

This section is an index to the registers in the TLB maintenance instructions functional group.

**Table K13-25 TLB maintenance system instructions**

| Register | Description, see |
|---|---|
| DTLBIALL | *DTLBIALL, Data TLB Invalidate All* on page G6-4302 |
| DTLBIASID | *DTLBIASID, Data TLB Invalidate by ASID match* on page G6-4304 |
| DTLBIMVA | *DTLBIMVA, Data TLB Invalidate by VA* on page G6-4306 |
| ITLBIALL | *ITLBIALL, Instruction TLB Invalidate All* on page G6-4464 |
| ITLBIASID | *ITLBIASID, Instruction TLB Invalidate by ASID match* on page G6-4466 |
| ITLBIMVA | *ITLBIMVA, Instruction TLB Invalidate by VA* on page G6-4468 |
| TLBIALL | *TLBIALL, TLB Invalidate All* on page G6-4567 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table K13-25 TLB maintenance system instructions (continued)**

| Register | Description, see |
|---|---|
| TLBIALLH | *TLBIALLH, TLB Invalidate All, Hyp mode* on page G6-4569 |
| TLBIALLHIS | *TLBIALLHIS, TLB Invalidate All, Hyp mode, Inner Shareable* on page G6-4571 |
| TLBIALLIS | *TLBIALLIS, TLB Invalidate All, Inner Shareable* on page G6-4573 |
| TLBIALLNSNH | *TLBIALLNSNH, TLB Invalidate All, Non-Secure Non-Hyp* on page G6-4575 |
| TLBIALLNSNHIS | *TLBIALLNSNHIS, TLB Invalidate All, Non-Secure Non-Hyp, Inner Shareable* on page G6-4577 |
| TLBIASID | *TLBIASID, TLB Invalidate by ASID match* on page G6-4579 |
| TLBIASIDIS | *TLBIASIDIS, TLB Invalidate by ASID match, Inner Shareable* on page G6-4581 |
| TLBIIPAS2 | *TLBIIPAS2, TLB Invalidate by Intermediate Physical Address, Stage 2* on page G6-4583 |
| TLBIIPAS2IS | *TLBIIPAS2IS, TLB Invalidate by Intermediate Physical Address, Stage 2, Inner Shareable* on page G6-4585 |
| TLBIIPAS2L | *TLBIIPAS2L, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level* on page G6-4587 |
| TLBIIPAS2LIS | *TLBIIPAS2LIS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, Inner Shareable* on page G6-4589 |
| TLBIMVA | *TLBIMVA, TLB Invalidate by VA* on page G6-4591 |
| TLBIMVAA | *TLBIMVAA, TLB Invalidate by VA, All ASID* on page G6-4593 |
| TLBIMVAAIS | *TLBIMVAAIS, TLB Invalidate by VA, All ASID, Inner Shareable* on page G6-4595 |
| TLBIMVAAL | *TLBIMVAAL, TLB Invalidate by VA, All ASID, Last level* on page G6-4597 |
| TLBIMVAALIS | *TLBIMVAALIS, TLB Invalidate by VA, All ASID, Last level, Inner Shareable* on page G6-4599 |
| TLBIMVAH | *TLBIMVAH, TLB Invalidate by VA, Hyp mode* on page G6-4601 |
| TLBIMVAHIS | *TLBIMVAHIS, TLB Invalidate by VA, Hyp mode, Inner Shareable* on page G6-4603 |
| TLBIMVAIS | *TLBIMVAIS, TLB Invalidate by VA, Inner Shareable* on page G6-4605 |
| TLBIMVAL | *TLBIMVAL, TLB Invalidate by VA, Last level* on page G6-4607 |
| TLBIMVALH | *TLBIMVALH, TLB Invalidate by VA, Last level, Hyp mode* on page G6-4609 |
| TLBIMVALHIS | *TLBIMVALHIS, TLB Invalidate by VA, Last level, Hyp mode, Inner Shareable* on page G6-4611 |
| TLBIMVALIS | *TLBIMVALIS, TLB Invalidate by VA, Last level, Inner Shareable* on page G6-4613 |

### K13.5.10 Legacy feature registers and system instructions

This section is an index to the registers in the Legacy feature registers functional group.

**Table K13-26 Legacy feature registers and system instructions**

| Register | Description, see |
|---|---|
| CP15DMB | *CP15DMB, CP15 Data Memory Barrier operation* on page G6-4261 |
| CP15DSB | *CP15DSB, CP15 Data Synchronization Barrier operation* on page G6-4263 |
| CP15ISB | *CP15ISB, CP15 Instruction Synchronization Barrier operation* on page G6-4265 |
| FCSEIDR | *FCSEIDR, FCSE Process ID register* on page G6-4310 |
| JIDR | *JIDR, Jazelle ID Register* on page G6-4470 |
| JMCR | *JMCR, Jazelle Main Configuration Register* on page G6-4472 |
| JOSCR | *JOSCR, Jazelle OS Control Register* on page G6-4473 |

### K13.5.11 Base System registers

This section is an index to the registers in the functional group.

**Table K13-27 Base System registers**

| Register | Description, see |
|---|---|
| ACTLR | *ACTLR, Auxiliary Control Register* on page G6-4214 |
| ACTLR2 | *ACTLR2, Auxiliary Control Register 2* on page G6-4216 |
| ADFSR | *ADFSR, Auxiliary Data Fault Status Register* on page G6-4218 |
| AIFSR | *AIFSR, Auxiliary Instruction Fault Status Register* on page G6-4222 |
| APSR | *APSR, Application Program Status Register* on page G6-4228 |
| CPACR | *CPACR, Architectural Feature Access Control Register* on page G6-4267 |
| CPSR | *CPSR, Current Program Status Register* on page G6-4271 |
| DFAR | *DFAR, Data Fault Address Register* on page G6-4294 |
| DFSR | *DFSR, Data Fault Status Register* on page G6-4296 |
| FPEXC | *FPEXC, Floating-Point Exception Control register* on page G6-4312 |
| HACR | *HACR, Hyp Auxiliary Configuration Register* on page G6-4326 |
| HACTLR | *HACTLR, Hyp Auxiliary Control Register* on page G6-4328 |
| HACTLR2 | *HACTLR2, Hyp Auxiliary Control Register 2* on page G6-4330 |
| HADFSR | *HADFSR, Hyp Auxiliary Data Fault Status Register* on page G6-4332 |
| HAIFSR | *HAIFSR, Hyp Auxiliary Instruction Fault Status Register* on page G6-4334 |
| HCPTR | *HCPTR, Hyp Architectural Feature Trap Register* on page G6-4340 |
| HCR | *HCR, Hyp Configuration Register* on page G6-4344 |
| HCR2 | *HCR2, Hyp Configuration Register 2* on page G6-4354 |

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**Table K13-27 Base System registers (continued)**

| Register | Description, see |
|---|---|
| HDFAR | *HDFAR, Hyp Data Fault Address Register* on page G6-4357 |
| HIFAR | *HIFAR, Hyp Instruction Fault Address Register* on page G6-4359 |
| HPFAR | *HPFAR, Hyp IPA Fault Address Register* on page G6-4367 |
| HRMR | *HRMR, Hyp Reset Management Register* on page G6-4369 |
| HSCTLR | *HSCTLR, Hyp System Control Register* on page G6-4371 |
| HSR | *HSR, Hyp Syndrome Register* on page G6-4376 |
| HSTR | *HSTR, Hyp System Trap Register* on page G6-4395 |
| HTPIDR | *HTPIDR, Hyp Software Thread ID Register* on page G6-4400 |
| HVBAR | *HVBAR, Hyp Vector Base Address Register* on page G6-4404 |
| IFAR | *IFAR, Instruction Fault Address Register* on page G6-4455 |
| IFSR | *IFSR, Instruction Fault Status Register* on page G6-4457 |
| ISR | *ISR, Interrupt Status Register* on page G6-4462 |
| MVBAR | *MVBAR, Monitor Vector Base Address Register* on page G6-4486 |
| NSACR | *NSACR, Non-Secure Access Control Register* on page G6-4500 |
| PAR | *PAR, Physical Address Register* on page G6-4504 |
| RMR (at EL1) | *RMR (at EL1), Reset Management Register* on page G6-4516 |
| RMR (at EL3) | *RMR (at EL3), Reset Management Register* on page G6-4518 |
| RVBAR | *RVBAR, Reset Vector Base Address Register* on page G6-4520 |
| SCR | *SCR, Secure Configuration Register* on page G6-4522 |
| SCTLR | *SCTLR, System Control Register* on page G6-4527 |
| TPIDRPRW | *TPIDRPRW, PL1 Software Thread ID Register* on page G6-4617 |
| TPIDRURO | *TPIDRURO, PL0 Read-Only Software Thread ID Register* on page G6-4619 |
| TPIDRURW | *TPIDRURW, PL0 Read/Write Software Thread ID Register* on page G6-4621 |
| VBAR | *VBAR, Vector Base Address Register* on page G6-4636 |

## K13.6 Alphabetical index of memory-mapped registers

This section is an index of memory-mapped registers in alphabetical order.

**Table K13-28 Alphabetical index of Memory-Mapped Registers**

| Register | Description, see |
|---|---|
| ASICCTL | *ASICCTL, CTI External Multiplexer Control register* on page H9-5055 |
| CNTACR<n> | *CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7* on page I3-5174 |
| CNTCR | *CNTCR, Counter Control Register* on page I3-5176 |
| CNTCV | *CNTCV, Counter Count Value register* on page I3-5178 |
| CNTEL0ACR | *CNTEL0ACR, Counter-timer EL0 Access Control Register* on page I3-5180 |
| CNTFID0 | *CNTFID0, Counter Frequency ID* on page I3-5182 |
| CNTFID<n> | *CNTFID<n>, Counter Frequency IDs, n = 1 - 23* on page I3-5183 |
| CNTFRQ | *CNTFRQ, Counter-timer Frequency* on page I3-5184 |
| CNTNSAR | *CNTNSAR, Counter-timer Non-secure Access Register* on page I3-5186 |
| CNTP_CTL | *CNTP_CTL, Counter-timer Physical Timer Control* on page I3-5188 |
| CNTP_CVAL | *CNTP_CVAL, Counter-timer Physical Timer CompareValue* on page I3-5190 |

## K13.7 Functional index of memory-mapped registers

This section is an index of the memory-mapped registers, divided by functional group.

### K13.7.1 ID registers

This section is an index to the registers in the Identification registers functional group.

**Table K13-29 ID registers**

| Register | Description, see |
|---|---|
| EDAA32PFR | *EDAA32PFR, External Debug AArch32 Processor Feature Register* on page H9-4989 |
| EDDFR | *EDDFR, External Debug Feature Register* on page H9-5006 |
| EDPFR | *EDPFR, External Debug Processor Feature Register* on page H9-5023 |
| MIDR_EL1 | *MIDR_EL1, Main ID Register* on page H9-5051 |

### K13.7.2 Performance monitors registers

This section is an index to the registers in the Performance Monitors registers functional group.

**Table K13-30 Performance monitors registers**

| Register | Description, see |
|---|---|
| PMAUTHSTATUS | *PMAUTHSTATUS, Performance Monitors Authentication Status register* on page I3-5122 |
| PMCCFILTR_EL0 | *PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register* on page I3-5124 |
| PMCCNTR_EL0 | *PMCCNTR_EL0, Performance Monitors Cycle Counter* on page I3-5126 |
| PMCEID0_EL0 | *PMCEID0_EL0, Performance Monitors Common Event Identification register 0* on page I3-5128 |
| PMCEID1_EL0 | *PMCEID1_EL0, Performance Monitors Common Event Identification register 1* on page I3-5129 |
| PMCFGR | *PMCFGR, Performance Monitors Configuration Register* on page I3-5130 |
| PMCIDR0 | *PMCIDR0, Performance Monitors Component Identification Register 0* on page I3-5132 |
| PMCIDR1 | *PMCIDR1, Performance Monitors Component Identification Register 1* on page I3-5133 |
| PMCIDR2 | *PMCIDR2, Performance Monitors Component Identification Register 2* on page I3-5134 |
| PMCIDR3 | *PMCIDR3, Performance Monitors Component Identification Register 3* on page I3-5135 |
| PMCNTENCLR_EL0 | *PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register* on page I3-5136 |
| PMCNTENSET_EL0 | *PMCNTENSET_EL0, Performance Monitors Count Enable Set register* on page I3-5138 |
| PMCR_EL0 | *PMCR_EL0, Performance Monitors Control Register* on page I3-5140 |
| PMDEVAFF0 | *PMDEVAFF0, Performance Monitors Device Affinity register 0* on page I3-5143 |
| PMDEVAFF1 | *PMDEVAFF1, Performance Monitors Device Affinity register 1* on page I3-5144 |
| PMDEVARCH | *PMDEVARCH, Performance Monitors Device Architecture register* on page I3-5145 |
| PMDEVTYPE | *PMDEVTYPE, Performance Monitors Device Type register* on page I3-5147 |

Non-Confidential - Beta

**Table K13-30 Performance monitors registers (continued)**

| Register | Description, see |
|---|---|
| PMEVCNTR<n>_EL0 | *PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30* on page I3-5148 |
| PMEVTYPER<n>_EL0 | *PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30* on page I3-5149 |
| PMINTENCLR_EL1 | *PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register* on page I3-5152 |
| PMINTENSET_EL1 | *PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register* on page I3-5154 |
| PMITCTRL | *PMITCTRL, Performance Monitors Integration mode Control register* on page I3-5156 |
| PMLAR | *PMLAR, Performance Monitors Lock Access Register* on page I3-5158 |
| PMLSR | *PMLSR, Performance Monitors Lock Status Register* on page I3-5159 |
| PMOVSCLR_EL0 | *PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear register* on page I3-5161 |
| PMOVSSET_EL0 | *PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register* on page I3-5163 |
| PMPIDR0 | *PMPIDR0, Performance Monitors Peripheral Identification Register 0* on page I3-5165 |
| PMPIDR1 | *PMPIDR1, Performance Monitors Peripheral Identification Register 1* on page I3-5166 |
| PMPIDR2 | *PMPIDR2, Performance Monitors Peripheral Identification Register 2* on page I3-5167 |
| PMPIDR3 | *PMPIDR3, Performance Monitors Peripheral Identification Register 3* on page I3-5168 |
| PMPIDR4 | *PMPIDR4, Performance Monitors Peripheral Identification Register 4* on page I3-5169 |
| PMSWINC_EL0 | *PMSWINC_EL0, Performance Monitors Software Increment register* on page I3-5170 |

### K13.7.3 Debug registers

This section is an index to the registers in the Debug registers functional group.

**Table K13-31 Debug registers**

| Register | Description, see |
|---|---|
| DBGAUTHSTATUS_EL1 | *DBGAUTHSTATUS_EL1, Debug Authentication Status register* on page H9-4968 |
| DBGBCR<n>_EL1 | *DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15* on page H9-4970 |
| DBGBVR<n>_EL1 | *DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15* on page H9-4973 |
| DBGCLAIMCLR_EL1 | *DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register* on page H9-4976 |
| DBGCLAIMSET_EL1 | *DBGCLAIMSET_EL1, Debug CLAIM Tag Set register* on page H9-4978 |
| DBGDTRRX_EL0 | *DBGDTRRX_EL0, Debug Data Transfer Register, Receive* on page H9-4980 |
| DBGDTRTX_EL0 | *DBGDTRTX_EL0, Debug Data Transfer Register, Transmit* on page H9-4982 |
| DBGWCR<n>_EL1 | *DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15* on page H9-4984 |
| DBGWVR<n>_EL1 | *DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15* on page H9-4987 |

|---|---|
| EDVIDSR | *EDVIDSR, External Debug Virtual Context Sample Register* on page H9-5048 |
| EDWAR | *EDWAR, External Debug Watchpoint Address Register* on page H9-5050 |
| OSLAR_EL1 | *OSLAR_EL1, OS Lock Access Register* on page H9-5053 |

### K13.7.4 Cross-trigger interface registers

This section is an index to the registers in the Cross-Trigger Interface registers functional group.

**Table K13-32 Cross-trigger interface registers**

| Register | Description, see |
|---|---|
| ASICCTL | *ASICCTL, CTI External Multiplexer Control register* on page H9-5055 |
| CTIAPPCLEAR | *CTIAPPCLEAR, CTI Application Trigger Clear register* on page H9-5056 |
| CTIAPPPULSE | *CTIAPPPULSE, CTI Application Pulse register* on page H9-5057 |
| CTIAPPSET | *CTIAPPSET, CTI Application Trigger Set register* on page H9-5058 |
| CTIAUTHSTATUS | *CTIAUTHSTATUS, CTI Authentication Status register* on page H9-5059 |
| CTICHINSTATUS | *CTICHINSTATUS, CTI Channel In Status register* on page H9-5061 |
| CTICHOUTSTATUS | *CTICHOUTSTATUS, CTI Channel Out Status register* on page H9-5062 |
| CTICIDR0 | *CTICIDR0, CTI Component Identification Register 0* on page H9-5063 |
| CTICIDR1 | *CTICIDR1, CTI Component Identification Register 1* on page H9-5064 |
| CTICIDR2 | *CTICIDR2, CTI Component Identification Register 2* on page H9-5065 |
| CTICIDR3 | *CTICIDR3, CTI Component Identification Register 3* on page H9-5066 |
| CTICLAIMCLR | *CTICLAIMCLR, CTI CLAIM Tag Clear register* on page H9-5067 |
| CTICLAIMSET | *CTICLAIMSET, CTI CLAIM Tag Set register* on page H9-5068 |
| CTICONTROL | *CTICONTROL, CTI Control register* on page H9-5069 |
| CTIDEVAFF0 | *CTIDEVAFF0, CTI Device Affinity register 0* on page H9-5070 |
| CTIDEVAFF1 | *CTIDEVAFF1, CTI Device Affinity register 1* on page H9-5071 |
| CTIDEVARCH | *CTIDEVARCH, CTI Device Architecture register* on page H9-5072 |
| CTIDEVID | *CTIDEVID, CTI Device ID register 0* on page H9-5074 |
| CTIDEVID1 | *CTIDEVID1, CTI Device ID register 1* on page H9-5076 |
| CTIDEVID2 | *CTIDEVID2, CTI Device ID register 2* on page H9-5077 |
| CTIDEVTYPE | *CTIDEVTYPE, CTI Device Type register* on page H9-5078 |
| CTIGATE | *CTIGATE, CTI Channel Gate Enable register* on page H9-5079 |
| CTIINEN<n> | *CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31* on page H9-5080 |
| CTIINTACK | *CTIINTACK, CTI Output Trigger Acknowledge register* on page H9-5081 |

# Glossary

**Note**

The update of the Glossary from ARMv7 to ARMv8 remains work-in-progress.

**A32 instruction** A word that specifies an operation to be performed by a PE that is executing in an Exception level that is using AArch32 and is in A32 state. A32 instructions must be word-aligned.

A32 instructions were previously called ARM instructions.

*See also* A32 state, A64 instruction, T32 instruction.

**A32 state** The AArch32 Instruction set state in which the PE executes A32 instructions.

A32 state was previously called ARM state.

*See also* T32 instruction, T32 state.

**A64 instruction** A word that specifies an operation to be performed by a PE that is executing in an Exception level that is using AArch64. A64 instructions must be word-aligned.

*See also* A32 instruction, T32 instruction.

**AArch32** The 32-bit Execution state. In AArch32 state, addresses are held in 32-bit registers, and instructions in the base instruction sets use 32-bit registers for their processing. AArch32 state supports the T32 and A32 instruction sets

*See also* AArch64, A32 instruction, T32 instruction.

**AArch64** The 64-bit Execution state. In AArch64 state, addresses are held in 64-bit registers, and instructions in the base instruction set can use 64-bit registers for their processing. AArch64 state supports the A64 instruction set.

*See also* AArch32, A64 instruction.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**Abort** An exception caused by an illegal memory access. Aborts can be caused by the external memory system or the MMU.

**Addressing mode**
Means a method for generating the memory address used by a load/store instruction.

**Advanced SIMD** A feature of the ARM architecture that provides SIMD operations on a register file of SIMD and floating-point registers. Where an implementation supports both Advanced SIMD and floating-point instructions, these instructions operate on the same register file.

**Aligned** A data item stored at an address that is exactly divisible by the highest power of 2 that divides exactly into its size in bytes. Aligned halfwords, words and doublewords therefore have addresses that are divisible by 2, 4 and 8 respectively.

An aligned access is one where the address of the access is aligned to the size of each element of the access.

**Architecturally executed**
An instruction is architecturally executed only if it would be executed in a simple sequential execution of the program. When such an instruction has been executed and retired it has been *architecturally executed*. Any instruction that, in a simple sequential execution of a program, is treated as a `NOP` because it fails its condition code check, is an architecturally executed instruction.

In a PE that performs speculative execution, an instruction is not architecturally executed if the PE discards the results of a speculative execution.

*See also* Condition code check, Simple sequential execution.

**Architecturally mapped**
Where this manual describes a register as being *architecturally mapped* to another register, this indicates that, in an implementation that supports both of the registers, the two registers access the same state.

**Architecturally UNKNOWN**
An architecturally UNKNOWN value is a value that is not defined by the architecture but must meet the requirements of the definition of UNKNOWN. Implementations can define the value of the field, but are not required to do so.

*See also* IMPLEMENTATION DEFINED.

**ARM core registers**
Some older documentation uses *ARM core registers* to refer to the following set of registers for execution in AArch32 state:

- The 13 general-purpose registers, R0-R12, that software can use for processing.
- SP, the *stack pointer*, that can also be referred to as R13.
- LR, the *link register*, that can also be referred to as R14.
- PC, the *program counter*, that can also be referred to as R15.

*See also* General-purpose registers.

**ARM instruction**
*See* A32 instruction.

**Associativity** *See* Cache associativity.

**Atomicity** Describes either single-copy atomicity or multi-copy atomicity. *Atomicity in the ARM architecture* on page B2-80 defines these forms of atomicity for the ARM architecture.

*See also* Multi-copy atomicity, Single-copy atomicity.

**Banked register** A register that has multiple instances, with the instance that is in use depending on the PE mode, Security state, or other PE state.

**Base register** A register specified by a load/store instruction that is used as the base value for the address calculation for the instruction. Depending on the instruction and its addressing mode, an offset can be added to or subtracted from the base register value to form the virtual address that is sent to memory.

**Base register writeback**
Describes writing back a modified value to the base register used in an address calculation.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Behaves as if** Where this manual indicates that a PE *behaves as if* a certain condition applies, all descriptions of the operation of the PE must be re-evaluated taking account of that condition, together with any other conditions that affect operation.

**Big-endian memory**

Means that, for example:

- A byte or halfword at a word-aligned address is the most significant byte or halfword in the word at that address.
- A byte at a halfword-aligned address is the most significant byte in the halfword at that address.

*See also* Endianness, Little-endian memory.

**Blocking** Describes an operation that does not permit following instructions to be executed before the operation completes.

A non-blocking operation can permit following instructions to be executed before the operation completes, and in the event of encountering an exception does not signal an exception to the PE. This enables implementations to retire following instructions while the non-blocking operation is executing, without the need to retain precise PE state.

**Branch prediction**

Is where a PE selects a future execution path to fetch along. For example, after a branch instruction, the PE can choose to speculatively fetch either the instruction following the branch or the instruction at the branch target.

*See also* Prefetching.

**Breakpoint** A debug event triggered by the execution of a particular instruction, specified by one or both of the address of the instruction and the state of the PE when the instruction is executed.

**Byte** An 8-bit data item.

**Cache associativity**

The number of locations in a cache set to which an address can be assigned. Each location is identified by its *way* value.

**Cache level** The position of a cache in the cache hierarchy. In the ARM architecture, the lower numbered levels are those closest to the PE. For more information, see *Terms used in describing the maintenance instructions* on page D3-1712.

**Cache line** The basic unit of storage in a cache. Its size in words is always a power of two, usually 4 or 8 words. A cache line must be aligned to a suitable memory boundary. A *memory cache line* is a block of memory locations with the same size and alignment as a cache line. Memory cache lines are sometimes loosely called cache lines.

**Cache lockdown**

Enables critical software and data to be loaded into the cache so that the cache lines containing them are not subsequently reallocated. It alleviates the delays caused by accessing a cache in a worst-case situation. This ensures that all subsequent accesses to the software and data concerned are cache hits and so complete quickly.

**Cache miss** A memory access that cannot be processed at high speed because the data it addresses is not in the cache.

**Cache sets** Areas of a cache, divided up to simplify and speed up the process of determining whether a cache hit occurs. The number of cache sets is always a power of two.

**Cache way** A cache way consists of one cache line from each cache set. The cache ways are indexed from 0 to (Associativity-1). Each cache line in a cache way is chosen to have the same index as the cache way. For example, cache way *n* consists of the cache line with index *n* from each cache set.

**Coherence order**

*See* Coherent.

**Coherent** Data accesses from a set of observers to a byte in memory are coherent if accesses to that byte in memory by the members of that set of observers are consistent with there being a single total order of all writes to that byte in memory by all members of the set of observers. This single total order of all to writes to that memory location is the *coherence order* for that byte in memory.

Non-Confidential - Beta

**Condition code check**
The process of determining whether a conditional instruction executes normally or is treated as a `NOP`. For an instruction that includes a condition code field, that field is compared with the condition flags to determine whether the instruction is executed normally. For a T32 instruction in an IT block, the value of PSTATE.IT determines whether the instruction is executed normally.

*See also* Condition code field, Condition flags, Conditional execution.

**Condition code field**
A 4-bit field in an instruction that specifies the condition under which the instruction executes.

*See also* Condition code check.

**Condition flags** The N, Z, C, and V bits of PSTATE, an SPSR, or FPSCR. See the register descriptions for more information.

*See also* Condition code check, PSTATE.

**Conditional execution**
When a conditional instruction starts executing, if the condition code check returns TRUE, the instruction executes normally. Otherwise, it is treated as a `NOP`.

*See also* Condition code check.

**CONSTRAINED UNPREDICTABLE**
Where an instruction can result in UNPREDICTABLE behavior, the ARMv8 architecture specifies a narrow range of permitted behaviors. This range is the range of CONSTRAINED UNPREDICTABLE behavior. All implementations that are compliant with the architecture must follow the CONSTRAINED UNPREDICTABLE behavior.

In body text, the term CONSTRAINED UNPREDICTABLE is shown in SMALL CAPITALS.

*See also* UNPREDICTABLE.

**Context switch** The saving and restoring of computational state when switching between different threads or processes. In this manual, the term context switch describes any situation where the context is switched by an operating system and might or might not include changes to the address space.

**Context synchronization operation**
One of:

- Performing an ISB operation. An ISB operation is performed when an `ISB` instruction is executed and does not fail its condition code check.
- Taking an exception.
- Returning from an exception.
- Exit from Debug state.
- Executing a `DCPS` instruction.
- Executing a `DRPS` instruction.

The architecture requires a context synchronization operation to guarantee visibility of any change to a System register.

**Debugger** In most of this manual, *debugger* refers to any agent that is performing debug. However, some parts of the manual require a more rigorous definition, and define debugger locally. See:

- *Definition of a debugger* on page D2-1636 for the definition that applies to Chapter D2.
- *Definition of a debugger* on page G2-3882 for the definition that applies to Chapter G2.
- *Definition of a debugger* on page H1-4816 for the definition that applies to Part H.

**Deprecated** Something that is present in the ARM architecture for backwards compatibility. Whenever possible software must avoid using deprecated features. Features that are deprecated but are not optional are present in current implementations of the ARM architecture, but might not be present, or might be deprecated and OPTIONAL, in future versions of the ARM architecture.

*See also* OPTIONAL.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Digital signal processing (DSP)**
Algorithms for processing signals that have been sampled and converted to digital form. DSP algorithms often use saturated arithmetic.

**Direct Memory Access (DMA)**
An operation that accesses main memory directly, without the PE performing any accesses to the data concerned.

**Direct read** A direct read of a System register is a read performed by a System register access instruction.

For more information, see *Direct read* on page D7-1910.

*See also* Direct write, Indirect read, Indirect write.

**Direct write** A direct write of a System register is a write performed by a System register access instruction.

For more information, see *Direct write* on page D7-1910.

*See also* Direct read, Indirect read, Indirect write.

**DMA** *See* Direct Memory Access (DMA).

**DNM** *See* Do-Not-Modify (DNM).

**Domain** In the ARM architecture, *domain* is used in the following contexts.

**Shareability domain** Defines a set of observers for which the shareability attributes make the data or unified caches transparent for data accesses.

**Power domain** Defines a block of logic with a single, common, power supply.

**Memory regions domain**
When using the Short-descriptor translation table format, defines a collection of Sections, Large pages and Small pages of memory, that can have their access permissions switched rapidly by writing to the *Domain Access Control Register* (DACR). ARM deprecates any use of memory regions domains.

**Do-Not-Modify (DNM)**
Means the value must not be altered by software. DNM fields read as UNKNOWN values, and must only be written with the value read from the same field on the same PE.

**Double-precision value**
Consists of two consecutive 32-bit words that are interpreted as a basic double-precision floating-point number according to the *IEEE Standard for Floating-point Arithmetic*.

**Doubleword** A 64-bit data item. Doublewords are normally at least word-aligned in ARM systems.

**Doubleword-aligned**
Means that the address is divisible by 8.

**DSP** *See* Digital signal processing (DSP).

**Endianness** An aspect of the system memory mapping.

*See also* Big-endian memory and Little-endian memory.

**Exception** Handles an event. For example, an exception could handle an external interrupt or an undefined instruction.

**Exception vector**
A fixed address that contains the address of the first instruction of the corresponding exception handler.

**Execution stream**
The stream of instructions that would have been executed by sequential execution of the program.

**Explicit access** A read from memory, or a write to memory, generated by a load or store instruction executed by the PE. Reads and writes generated by hardware translation table accesses are not explicit accesses.

**External abort** An abort that is generated by the external memory system.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Fast Context Switch Extension (FCSE)**
Modifies the behavior of an ARM memory system to enable multiple programs running on the ARM PE to use identical address ranges, while ensuring that the addresses they present to the rest of the memory system differ. From ARMv6, ARM deprecates any use of the FCSE. The FCSE is:

- Optional in an ARMv7 implementation that does not include the Multiprocessing Extensions.
- Obsolete from the introduction of the Multiprocessing Extensions.

**FCSE** *See* Fast Context Switch Extension (FCSE).

**Flat address mapping**
Is where the physical address for every access is equal to its virtual address.

**Flush-to-zero mode**
A processing mode that optimizes the performance of some floating-point algorithms by replacing the denormalized operands and intermediate results with zeros, without significantly affecting the accuracy of their final results.

**General-purpose registers**
The registers that the base instructions use for processing:

- In AArch32 state the general-purpose registers are R0-R14, that can also be described as R0-R12, SP, LR.

  **Note**

  Older documentation defines the AArch32 general-purpose registers as R0-R12, and the ARM core registers as R0-R12, SP, LR, and PC.

- In AArch64 state the general-purpose registers are:
  - W0-W30 when accessed as 32-bit registers.
  - X0-X30 when accessed as 64-bit registers.

*See also* High registers, Low registers.

**Halfword** A 16-bit data item. Halfwords are normally halfword-aligned in ARM systems.

**Halfword-aligned**
Means that the address is divisible by 2.

**High registers** In AArch32 state, the general-purpose registers R8-R14. Most 16-bit T32 instructions cannot access the high registers.

**Note**

- In some contexts, *high registers* refers to R8-R15, meaning R8-R14 and the PC.

*See also* General-purpose registers, Low registers.

**High vectors** An alternative location for the exception vectors. The high vector address range is near the top of the address space, rather than at the bottom.

**IGNORED** Indicates that the architecture guarantees that the bit or field is not interpreted or modified by hardware.

In body text, the term IGNORED is shown in SMALL CAPITALS.

**Immediate and offset fields**
Are unsigned unless otherwise stated.

**Immediate value**
A value that is encoded directly in the instruction and used as numeric data when the instruction is executed. Many A64, A32, and T32 instructions can be used with an immediate argument.

**IMP** An abbreviation used in diagrams to indicate that one or more bits have IMPLEMENTATION DEFINED behavior.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**IMPLEMENTATION DEFINED**
Means that the behavior is not architecturally defined, but must be defined and documented by individual implementations.

In body text, the term IMPLEMENTATION DEFINED is shown in SMALL CAPITALS.

**Index register** A register specified in some load and store instructions. The value of this register is used as an offset to be added to or subtracted from the base register value to form the virtual address that is sent to memory. Some instruction forms permit the index register value to be shifted before the addition or subtraction.

**Indirect read** When an instruction uses a System register value to establish operating conditions, that use of the System register is an indirect read of the System register.

For more information, including additional examples of indirect reads, see *Indirect read* on page D7-1910.

*See also* Direct read, Direct write, Indirect write.

**Indirect write** An indirect write of a System register occurs when the contents of a register are updated by some mechanism other than a *Direct write* to that register. For example, an indirect write to a register might occur as a side-effect of executing an instruction that does not perform a direct write to the register, or because of some operation performed by an external agent.

For more information, see *Indirect write* on page D7-1910.

*See also* Direct read, Direct write, Indirect read.

**Inline literals** These are constant addresses and other data items held in the same area as the software itself. They are automatically generated by compilers, and can also appear in assembler code.

**Intermediate physical address (IPA)**
An implementation of virtualization, the address to which a Guest OS maps a VA. A hypervisor might then map the IPA to a PA. Typically, the Guest OS is unaware of the translation from IPA to PA.

*See also* Physical address (PA), Virtual address (VA).

**Interworking** A method of working that permits branches between software using the A32 and T32 instruction sets.

**IPA** *See* Intermediate physical address (IPA).

**Level** *See* Cache level.

**Level of Coherence (LoC)**
The last level of cache that must be cleaned or invalidated when cleaning or invalidating to the point of coherency. For more information, see *Terms used in describing the maintenance instructions* on page D3-1712.

*See also* Cache level, Point of coherency (PoC).

**Level of Unification, Inner Shareable (LoUIS)**
The last level of cache that must be cleaned or invalidated when cleaning or invalidating to the point of unification for the Inner Shareable shareability domain. For more information, see *Terms used in describing the maintenance instructions* on page D3-1712.

*See also* Cache level, Point of unification (PoU).

**Level of Unification, uniprocessor (LoUU)**
For a PE, the last level of cache that must be cleaned or invalidated when cleaning or invalidating to the point of unification for that PE. For more information, see *Terms used in describing the maintenance instructions* on page D3-1712.

*See also* Cache level, Point of unification (PoU).

**Line** *See* Cache line.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Little-endian memory**
Means that, for example:

- A byte or halfword at a word-aligned address is the least significant byte or halfword in the word at that address.
- A byte at a halfword-aligned address is the least significant byte in the halfword at that address.

*See also* Big-endian memory, .Endianness.

**Load/Store architecture**
An architecture where data-processing operations only operate on register contents, not directly on memory contents.

**LoC** *See* Level of Coherence (LoC).

**LoUIS** *See* Level of Unification, Inner Shareable (LoUIS).

**LoUU** *See* Level of Unification, uniprocessor (LoUU).

**Lockdown** *See* Cache lockdown.

**Low registers** InAArch32 state, general-purpose registers R0-R7. Unlike the high registers, all T32 instructions can access the Low registers.

*See also* General-purpose registers, High registers.

**Memory barrier** *See Memory barriers* on page B2-86.

**Memory coherency**
The problem of ensuring that when a memory location is read, either by a data read or an instruction fetch, the value actually obtained is always the value that was most recently written to the location. This can be difficult when there are multiple possible physical locations, such as main memory and at least one of a write buffer and one or more levels of cache.

**Memory Management Unit (MMU)**
Provides detailed control of the part of a memory system that provides a single stage of address translation. Most of the control is provided using translation tables that are held in memory, and define the attributes of different regions of the physical memory map.

**Memory Protection Unit (MPU)**
A hardware unit whose registers provide simple control of a limited number of protection regions in memory.

**Miss** *See* Cache miss.

**MMU** *See* Memory Management Unit (MMU).

**MPU** *See* Memory Protection Unit (MPU).

**Multi-copy atomicity**
The form of atomicity described in *Requirements for multi-copy atomicity* on page B2-81.

*See also* Atomicity, Single-copy atomicity.

**NaN**

- Not a Number. A floating-point value that can be used when neither a numeric value nor an infinity is appropriate. A NaN can be a *quiet* NaN, that propagate through most floating-point operations, or a *signaling* NaN, that causes an Invalid Operation floating-point exception when used. For more information, see the *IEEE Standard for Floating-point Arithmetic*.

**Natural eviction** A natural eviction is an eviction that occurs in the course of the normal operation of the memory system, rather than because of an operation that explicitly causes an eviction from the cache, such as the execution of a cache maintenance instruction. Typically, a natural eviction occurs when the caching algorithm requires data to be cached but the cache does not have room for that data.

**Observer** A PE or mechanism in the system, such as a peripheral device, that can generate reads from or writes to memory.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Obsolete** Obsolete indicates something that is no longer supported by ARM. When an architectural feature is described as obsolete, this indicates that the architecture has no support for that feature, although an earlier version of the architecture did support it.

**Offset addressing**
Means that the memory address is formed by adding or subtracting an offset to or from the base register value.

**OPTIONAL** When applied to a feature of the architecture, OPTIONAL indicates a feature that is not required in an implementation of the ARM architecture:

- If a feature is OPTIONAL and deprecated, this indicates that the feature is being phased out of the architecture. ARM expects such a features to be included in a new implementation only if there is a known backwards-compatibility reason for the inclusion of the feature.

  A feature that is OPTIONAL and deprecated might not be present in future versions of the architecture.

- A feature that is OPTIONAL but not deprecated is, typically, a feature added to a version of the ARM architecture after the initial release of that version of the architecture. ARM recommends that such features are included in all new implementations of the architecture.

In body text, these meanings of the term OPTIONAL are shown in SMALL CAPITALS.

**Note**: Do not confuse these ARM-specific uses of OPTIONAL with other uses of *optional*, where it has its usual meaning. These include:

- Optional arguments in the syntax of many instructions.
- Behavior determined by an implementation choice, for example the optional byte order reversal in an ARMv7-R implementation, where the SCTLR.IE bit indicates the implemented option.

*See also* Deprecated.

**PA** *See* Physical address (PA).

**PE** *See* Processing element (PE).

**Physical address (PA)**
An address that identifies a location in the physical memory map.

*See also* Intermediate physical address (IPA), Virtual address (VA).

**PoC** *See* Point of coherency (PoC).

**PoU** *See* Point of unification (PoU).

**Point of coherency (PoC)**
For a particular MVA, the point at which all agents that can access memory are guaranteed to see the same copy of a memory location. For more information, see *Terms used in describing the maintenance instructions* on page D3-1712.

**Point of unification (PoU)**
For a particular PE, the point by which the instruction and data caches and the translation table walks of that PE are guaranteed to see the same copy of a memory location. For more information, see *Terms used in describing the maintenance instructions* on page D3-1712.

**Post-indexed addressing**
Means that the memory address is the base register value, but an offset is added to or subtracted from the base register value and the result is written back to the base register.

**Prefetching** Prefetching refers to speculatively fetching instructions or data from the memory system. In particular, instruction prefetching is the process of fetching instructions from memory before the instructions that precede them, in simple sequential execution of the program, have finished executing. Prefetching an instruction does not mean that the instruction has to be executed.

In this manual, references to instruction or data fetching apply also to prefetching, unless the context explicitly indicates otherwise.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

The Prefetch Abort exception can be generated on any instruction fetch, and is not limited to speculative instruction fetches.

*See also* Simple sequential execution.

**Pre-indexed addressing**
Means that the memory address is formed in the same way as for offset addressing, but the memory address is also written back to the base register.

**Processing element (PE)**
The abstract machine defined in the ARM architecture, as documented in an ARM Architecture Reference Manual. A PE implementation compliant with the ARM architecture must conform with the behaviors described in the corresponding ARM Architecture Reference Manual.

**Protection region**
A memory region whose position, size, and other properties are defined by Memory Protection Unit registers.

**Protection Unit** *See* Memory Protection Unit (MPU).

**Pseudo-instruction**
UAL assembler syntax that assembles to an instruction encoding that is expected to disassemble to a different assembler syntax, and is described in this manual under that other syntax. For example, `MOV <Rd>, <Rm>, LSL #<n>` is a pseudo-instruction that is expected to disassemble as `LSL <Rd>, <Rm>, #<n>`.

**PSTATE** An abstraction of process state information. All of the instruction sets provide instructions that operate on elements of PSTATE.

*See also* Condition flags.

**Quadword** A 128-bit data item. Quadwords are normally at least word-aligned in ARM systems.

**Quadword-aligned**
Means that the address is divisible by 16.

**Quiet NaN** A NaN that propagates unchanged through most floating-point operations.

**RAO** *See* Read-As-One (RAO).

**RAZ** *See* Read-As-Zero (RAZ).

**RAO/SBOP** In versions of the ARM architecture before ARMv8, Read-As-One, Should-Be-One-or-Preserved on writes.

In ARMv8, RES1 replaces this description.

*See also* UNK/SBOP, Read-As-One (RAO), RES1, Should-Be-One-or-Preserved (SBOP).

**RAO/WI** Read-As-One, Writes Ignored.

Hardware must implement the field as Read-as-One, and must ignore writes to the field.

Software can rely on the field reading as all 1s, and on writes being ignored.

This description can apply to a single bit that reads as 1, or to a field that reads as all 1s.

*See also* Read-As-One (RAO).

**RAZ/SBZP** In versions of the ARM architecture before ARMv8, Read-As-Zero, Should-Be-Zero-or-Preserved on writes.

In ARMv8, RES0 replaces this description.

*See also* UNK/SBZP, Read-As-Zero (RAZ), RES0, Should-Be-Zero-or-Preserved (SBZP).

**RAZ/WI** Read-As-Zero, Writes Ignored.

Hardware must implement the field as Read-as-Zero, and must ignore writes to the field.

Software can rely on the field reading as all 0s, and on writes being ignored.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

This description can apply to a single bit that reads as 0, or to a field that reads as all 0s.

*See also* Read-As-Zero (RAZ).

**Read-allocate cache**

A cache in which a cache miss on reading data causes a cache line to be allocated into the cache.

**Read-As-One (RAO)**

Hardware must implement the field as reading as all 1s.

Software:

- Can rely on the field reading as all 1s.
- Must use a SBOP policy to write to the field.

This description can apply to a single bit that reads as 1, or to a field that reads as all 1s.

**Read-As-Zero (RAZ)**

Hardware must implement the field as reading as all 0s.

Software:

- Can rely on the field reading as all 0s
- Must use a SBZP policy to write to the field.

This description can apply to a single bit that reads as 0, or to a field that reads as all 0s.

**Read, modify, write**

In a read, modify, write instruction sequence, a value is read to a general-purpose register, the relevant fields updated in that register, and the new value written back.

**RES0**

A reserved bit or field with *Should-Be-Zero-or-Preserved (SBZP)* behavior. Used for fields in register descriptions, and for fields in architecturally-defined data structures that are held in memory, for example in translation table descriptors.

Within the architecture, there are some cases where a register bit or bitfield:

- Is RES0 in some defined architectural context.
- Has different defined behavior in a different architectural context.

**Note**

- RES0 is not used in descriptions of instruction encodings.
- Where an AArch32 System register is *Architecturally mapped* to an AArch64 System register, and a bit or field in that register is RES0 in one Execution state and has defined behavior in the other Execution state, this is an example of a bit or field with behavior that depends on the architectural context.

This means the definition of RES0 for register fields is:

**If a bit is RES0 in all contexts**

It is IMPLEMENTATION DEFINED whether:

1. The bit is hardwired to 0. In this case:
   - Reads of the bit always return 0.
   - Writes to the bit are ignored.
2. The bit can be written. In this case:
   - An indirect write to the register sets the bit to 0.
   - A read of the bit returns the last value successfully written, by either a direct or an indirect write, to the bit.

     If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- A direct write to the bit must update a storage location associated with the bit.
- The value of the bit must have no effect on the operation of the PE, other than determining the value read back from the bit, unless this Manual explicitly defines additional properties for the bit.

Whether RES0 bits or fields follow behavior 1 or behavior 2 is IMPLEMENTATION DEFINED on a field-by-field basis.

**If a bit is RES0 only in some contexts**

When the bit is described as RES0:

- An indirect write to the register sets the bit to 0.
- A read of the bit must return the value last successfully written to the bit, by either a direct or an indirect write, regardless of the use of the register when the bit was written.

  If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
- A direct write to the bit must update a storage location associated with the bit.
- While the use of the register is such that the bit is described as RES0, the value of the bit must have no effect on the operation of the PE, other than determining the value read back from that bit, unless this Manual explicitly defines additional properties for the bit.

A bit that is RES0 in a context is reserved for possible future use in that context. To preserve forward compatibility, software:

- Must not rely on the bit reading as 0.
- Must use an SBZP policy to write to the bit.

The RES0 description can apply to bits or bitfields that are read-only, or are write-only:

- For a read-only bit, RES0 indicates that the bit reads as 0, but software must treat the bit as UNKNOWN.
- For a write-only bit, RES0 indicates that software must treat the bit as SBZ.

This RES0 description can apply to a single bit that should be written as its preserved value or as 0, or to a field that should be written as its preserved value or as all 0s.

In body text, the term RES0 is shown in SMALL CAPITALS.

*See also* Read-As-Zero (RAZ), RES1, Should-Be-Zero-or-Preserved (SBZP), UNKNOWN.

**RES1**

A reserved bit or field with *Should-Be-One-or-Preserved (SBOP)* behavior. Used for fields in register descriptions, and for fields in architecturally-defined data structures that are held in memory, for example in translation table descriptors.

Within the architecture, there are some cases where a register bit or bitfield:

- Is RES1 in some defined architectural context.
- Has different defined behavior in a different architectural context.

**Note**

- RES1 is not used in descriptions of instruction encodings.
- Where an AArch32 System register is *Architecturally mapped* to an AArch64 System register, and a bit or field in that register is RES1 in one Execution state and has defined behavior in the other Execution state, this is an example of a bit or field with behavior that depends on the architectural context.

This means the definition of RES1 for register fields is:

**If a bit is RES1 in all contexts**

It is IMPLEMENTATION DEFINED whether:

1. The bit is hardwired to 1. In this case:
   - Reads of the bit always return 1.
   - Writes to the bit are ignored.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

2. The bit can be written. In this case:
   - An indirect write to the register sets the bit to 1.
   - A read of the bit returns the last value successfully written, by either a direct or an indirect write, to the bit.

     If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
   - A direct write to the bit must update a storage location associated with the bit.
   - The value of the bit must have no effect on the operation of the PE, other than determining the value read back from the bit, unless this Manual explicitly defines additional properties for the bit.

   Whether RES1 bits or fields follow behavior 1 or behavior 2 is IMPLEMENTATION DEFINED on a field-by-field basis.

**If a bit is RES1 only in some contexts**

When the bit is described as RES1:
- An indirect write to the register sets the bit to 1.
- A read of the bit must return the value last successfully written to the bit, regardless of the use of the register when the bit was written.

  **Note**

  As indicated in this list, this value might be written by an indirect write to the register.

  If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
- A direct write to the bit must update a storage location associated with the bit.
- While the use of the register is such that the bit is described as RES1, the value of the bit must have no effect on the operation of the PE, other than determining the value read back from that bit, unless this Manual explicitly defines additional properties for the bit.

A bit that is RES1 in a context is reserved for possible future use in that context. To preserve forward compatibility, software:
- Must not rely on the bit reading as 1.
- Must use an SBOP policy to write to the bit.

The RES1 description can apply to bits or bitfields that are read-only, or are write-only:
- For a read-only bit, RES1 indicates that the bit reads as 1, but software must treat the bit as UNKNOWN.
- For a write-only bit, RES1 indicates that software must treat the bit as SBO.

This RES1 description can apply to a single bit that should be written as its preserved value or as 1, or to a field that should be written as its preserved value or as all 1s.

In body text, the term RES1 is shown in SMALL CAPITALS.

*See also* Read-As-One (RAO), RES0, Should-Be-One-or-Preserved (SBOP), UNKNOWN.

**Reserved**

Unless otherwise stated:
- Instructions that are reserved or that access reserved registers have UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior.
- Bit positions described as reserved are:
  - In an RW or WO register, RES0.
  - In an RO register, UNK.

*See also* RES0, RES1, UNK.

**RISC**

Reduced Instruction Set Computer.

**Rounding error**

The value of the rounded result of an arithmetic operation minus the exact result of the operation.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Rounding mode** Specifies how the exact result of a floating-point operation is rounded to a value that is representable in the destination format. The rounding modes are defined by the *IEEE Standard for Floating-point Arithmetic*, see *Floating-point standards, and terminology* on page A1-48.

**Saturated arithmetic**
Integer arithmetic in which a result that would be greater than the largest representable number is set to the largest representable number, and a result that would be less than the smallest representable number is set to the smallest representable number. Signed saturated arithmetic is often used in DSP algorithms. It contrasts with the normal signed integer arithmetic used in ARM processors, in which overflowing results wrap around from $+2^{31}–1$ to $–2^{31}$ or vice versa.

**SBO** *See* Should-Be-One (SBO).

**SBOP** *See* Should-Be-One-or-Preserved (SBOP).

**SBZ** *See* Should-Be-Zero (SBZ).

**SBZP** *See* Should-Be-Zero-or-Preserved (SBZP).

**Security hole** A mechanism by which execution at the current level of privilege can achieve an outcome that cannot be achieved at the current or a lower level of privilege using instructions that are not UNPREDICTABLE. The ARM architecture forbids security holes.

**Self-modifying code**
Code that writes one or more instructions to memory and then executes them. When using self-modifying code, you must use cache maintenance and barrier instructions to ensure synchronization. For more information, see *Caches and memory hierarchy* on page B2-70.

**Set** *See* Cache sets.

**Should-Be-One (SBO)**
Hardware must ignore writes to the field.

ARM strongly recommends that software writes the field as all 1s. If software writes a value that is not all 1s, it must expect an UNPREDICTABLE result.

This description can apply to a single bit that should be written as 1, or to a field that should be written as all 1s.

**Should-Be-One-or-Preserved (SBOP)**
From the introduction of the ARMv8 architecture, the description *Should-Be-One-or-Preserved (SBOP)* is superseded by *RES1*.

**Note**

The ARMv7 Large Physical Address Extension modified the definition of SBOP for register bits that are SBOP in some but not all contexts. The behavior of these bits is covered by the *RES1* definition, but not by the generic definition of SBOP given here.

Hardware must ignore writes to the field.

If software has read the field since the PE implementing the field was last reset and initialized, it must preserve the value of the field by writing the value that it previously read from the field. Otherwise, it must write the field as all 1s.

If software writes a value to the field that is not a value previously read for the field and is not all 1s, it must expect an UNPREDICTABLE result.

This description can apply to a single bit that should be written as its preserved value or as 1, or to a field that should be written as its preserved value or as all 1s.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**Should-Be-Zero (SBZ)**
Hardware must ignore writes to the field.

ARM strongly recommends that software writes the field as all 0s. If software writes a value that is not all 0s, it must expect an UNPREDICTABLE result.

This description can apply to a single bit that should be written as 0, or to a field that should be written as all 0s.

**Should-Be-Zero-or-Preserved (SBZP)**
From the introduction of the ARMv8 architecture, the description *Should-Be-Zero-or-Preserved (SBZP)* is superseded by *RES0*.

**Note**

The ARMv7 Large Physical Address Extension modified the definition of SBZP for register bits that are SBZP in some but not all contexts. The behavior of these bits is covered by the *RES0* definition, but not by the generic definition of SBZP given here.

Hardware must ignore writes to the field.

If software has read the field since the PE implementing the field was last reset and initialized, it must preserve the value of the field by writing the value that it previously read from the field. Otherwise, it must write the field as all 0s.

If software writes a value to the field that is not a value previously read for the field and is not all 0s, it must expect an UNPREDICTABLE result.

This description can apply to a single bit that should be written as its preserved value or as 0, or to a field that should be written as its preserved value or as all 0s.

**Signaling NaNs** Cause an Invalid Operation exception whenever any floating-point operation receives a signaling NaN as an operand. Signaling NaNs can be used in debugging, to track down some uses of uninitialized variables.

**Signed immediate and offset fields**
Are encoded in two's complement notation unless otherwise stated.

**SIMD** Single-Instruction, Multiple-Data.

The SIMD instructions in AArch32 state are:

- The instructions summarized in *Parallel addition and subtraction instructions* on page F1-2418.
- The Advanced SIMD instructions summarized in *Advanced SIMD and floating-point instructions* on page E1-2325, when operating on vectors.

  **Note**

  In ARMv7, some VFP instructions can operate on vectors. However, ARM deprecates those instruction uses, and strongly recommends that Advanced SIMD instructions are always used for vector operations.

**Simple sequential execution**
The behavior of an implementation that fetches, decodes and completely executes each instruction before proceeding to the next instruction. Such an implementation performs no speculative accesses to memory, including to instruction memory. The implementation does not pipeline any phase of execution. In practice, this is the theoretical execution model that the architecture is based on, and ARM does not expect this model to correspond to a realistic implementation of the architecture.

**Single-copy atomicity**
The form of atomicity described in *Properties of single-copy atomic accesses* on page B2-81.

*See also* Atomicity, Multi-copy atomicity.

**Single-precision value**
A 32-bit word that is interpreted as a basic single-precision floating-point number according to the *IEEE Standard for Floating-point Arithmetic*.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Spatial locality** The observed effect that after a program has accessed a memory location, it is likely to also access nearby memory locations in the near future. Caches with multi-word cache lines exploit this effect to improve performance.

**Special-purpose register**
One of a specified set of registers for which all direct and indirect reads and writes to the register appear to occur in program order relative to other instructions, without the need for any explicit synchronization:

- *Special-purpose registers* on page C5-289 specifies the AArch64 Special-purpose registers.
- *AArch32 Special-purpose registers* on page G1-3764 lists the AArch32 Special-purpose registers.

**T32 instruction** One or two halfwords that specify an operation to be performed by a PE that is executing in an Exception level that is using AArch32 and is in T32 state. T32 instructions must be halfword-aligned.

T32 instructions were previously called Thumb instructions.

*See also* A32 instruction, A64 instruction, T32 state.

**T32 state** The AArch32 Instruction set state in which the PE executes T32 instructions.

T32 state was previously called Thumb state.

*See also* A32 state, T32 instruction.

**Temporal locality**
The observed effect that after a program has accesses a memory location, it is likely to access the same memory location again in the near future. Caches exploit this effect to improve performance.

**Thumb instruction**
*See* T32 instruction.

**TLB** *See* Translation Lookaside Buffer (TLB).

**TLB lockdown** A way to prevent specific translation table walk results being accessed. This ensures that accesses to the associated memory areas never cause a translation table walk.

**Translation Lookaside Buffer (TLB)**
A memory structure containing the results of translation table walks. They help to reduce the average cost of a memory access. Usually, there is a TLB for each memory interface of the ARM implementation.

**Translation table**
A table held in memory that defines the properties of memory areas of various sizes from 1KB to 1MB.

**Translation table walk**
The process of doing a full translation table lookup. It is performed automatically by hardware.

**Trap enable bits** In VFPv2, VFPv3U, and VFPv4U, determine whether trapped or untrapped exception handling is selected. If trapped exception handling is selected, the way it is carried out is IMPLEMENTATION DEFINED.

**Unaligned** An unaligned access is an access where the address of the access is not aligned to the size of an element of the access.

**Unaligned memory accesses**
Are memory accesses that are not, or might not be, appropriately halfword-aligned, word-aligned, or doubleword-aligned.

**Unallocated** Except where otherwise stated in this manual, an instruction encoding is unallocated if the architecture does not assign a specific function to the entire bit pattern of the instruction, but instead describes it as CONSTRAINED UNPREDICTABLE, UNDEFINED, UNPREDICTABLE, or an unallocated hint instruction.

A bit in a register is unallocated if the architecture does not assign a function to that bit.

**UNDEFINED** Indicates an instruction that generates an Undefined Instruction exception.

In body text, the term UNDEFINED is shown in SMALL CAPITALS.

*See also Undefined Instruction exception* on page G1-3811.

**Unified cache** Is a cache used for both processing instruction fetches and processing data loads and stores.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**Unindexed addressing**
Means addressing in which the base register value is used directly as the virtual address to send to memory, without adding or subtracting an offset. In most types of load/store instruction, unindexed addressing is performed by using offset addressing with an immediate offset of 0. The `LDC`, `LDC2`, `STC`, and `STC2` instructions have an explicit unindexed addressing mode that permits the offset field in the instruction to specify additional coprocessor options.

**UNK**
An abbreviation indicating that software must treat a field as containing an UNKNOWN value.

Hardware must implement the bit as read as 0, or all 0s for a multi-bit field. Software must not rely on the field reading as zero.

*See also* UNKNOWN.

**UNK/SBOP**
Hardware must implement the field as Read-As-One, and must ignore writes to the field.

Software must not rely on the field reading as all 1s, and except for writing back to the register it must treat the value as if it is UNKNOWN. Software must use an SBOP policy to write to the field.

This description can apply to a single bit that should be written as its preserved value or as 1, or to a field that should be written as its preserved value or as all 1s.

*See also* Read-As-One (RAO), Should-Be-One-or-Preserved (SBOP), UNKNOWN.

**UNK/SBZP**
Hardware must implement the bit as Read-As-Zero, and must ignore writes to the field.

Software must not rely on the field reading as all 0s, and except for writing back to the register must treat the value as if it is UNKNOWN. Software must use an SBZP policy to write to the field.

This description can apply to a single bit that should be written as its preserved value or as 0, or to a field that should be written as its preserved value or as all 0s.

*See also* Read-As-Zero (RAZ), Should-Be-Zero-or-Preserved (SBZP), UNKNOWN.

**UNKNOWN**
An UNKNOWN value does not contain valid data, and can vary from moment to moment, instruction to instruction, and implementation to implementation. An UNKNOWN value must not return information that cannot be accessed at the current or a lower level of privilege using instructions that are not UNPREDICTABLE and do not return UNKNOWN values.

An UNKNOWN value must not be documented or promoted as having a defined value or effect.

In body text, the term UNKNOWN is shown in SMALL CAPITALS.

*See also* UNK.

**UNPREDICTABLE**
Means the behavior cannot be relied upon. UNPREDICTABLE behavior must not perform any function that cannot be performed at the current or a lower level of privilege using instructions that are not UNPREDICTABLE.

UNPREDICTABLE behavior must not be documented or promoted as having a defined effect.

An instruction that is UNPREDICTABLE can be implemented as UNDEFINED.

Execution in a Non-secure EL1 or EL0 mode of an instruction that is UNPREDICTABLE can be implemented as generating a Hyp Trap exception, provided that at least one instruction that is not UNPREDICTABLE causes a Hyp Trap exception.

In body text, the term UNPREDICTABLE is shown in SMALL CAPITALS.

*See also* CONSTRAINED UNPREDICTABLE.

**VA**
*See* Virtual address (VA).

**VFP**
In ARMv7, an extension to the ARM architecture, that provides single-precision and double-precision floating-point arithmetic.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**Virtual address (VA)**
An address generated by an ARM PE. This means it is an address that might be held in the program counter of the PE. For a PMSA implementation, the virtual address is identical to the physical address.

*See also* Intermediate physical address (IPA), Physical address (PA).

**Watchpoint** A debug event triggered by an access to memory, specified in terms of the address of the location in memory being accessed.

**Way** *See* Cache way.

**WI** Writes Ignored. In a register that software can write to, a WI attribute applied to a bit or field indicates that the bit or field ignores the value written by software and retains the value it had before that write.

*See also* RAO/WI, RAZ/WI, RES0, RES1.

**Word** A 32-bit data item. Words are normally word-aligned in ARM systems.

**Word-aligned** Means that the address is divisible by 4.

**Write-allocate cache**
A cache in which a cache miss on storing data causes a cache line to be allocated into the cache.

**Write-back cache**
A cache in which when a cache hit occurs on a store access, the data is only written to the cache. Data in the cache can therefore be more up-to-date than data in main memory. Any such data is written back to main memory when the cache line is cleaned or reallocated. Another common term for a write-back cache is a *copy-back cache*.

**Write-through cache**
A cache in which when a cache hit occurs on a store access, the data is written both to the cache and to main memory. This is normally done via a write buffer, to avoid slowing down the PE.

**Write buffer** A block of high-speed memory that optimizes stores to main memory.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*
